

# Recitation 6

Vivek Jayaram

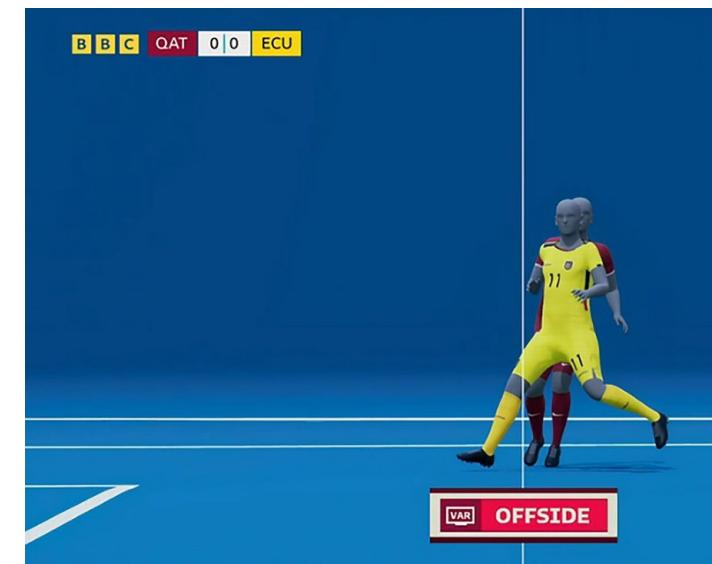

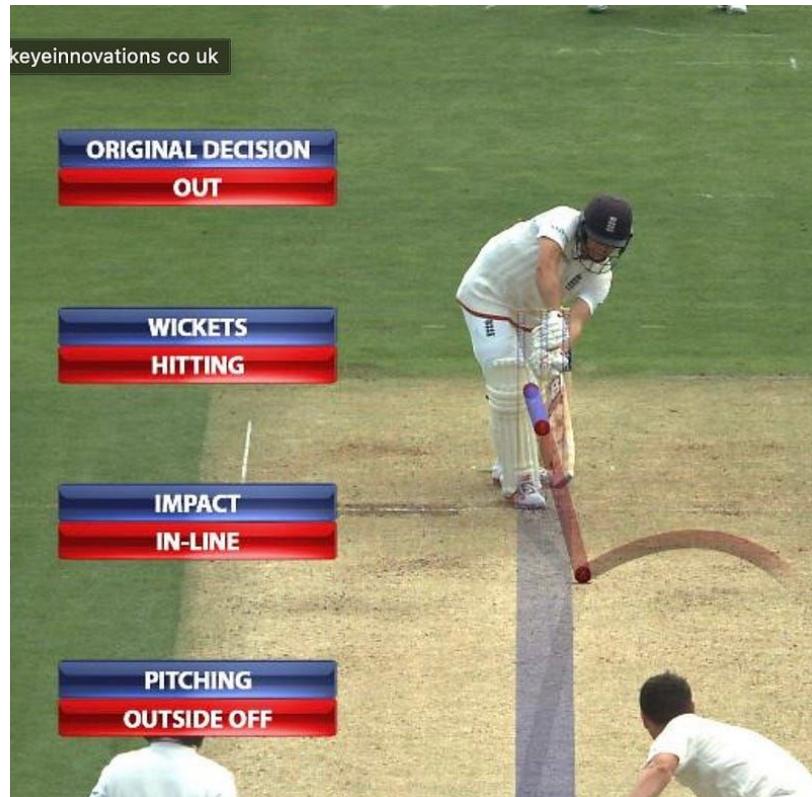

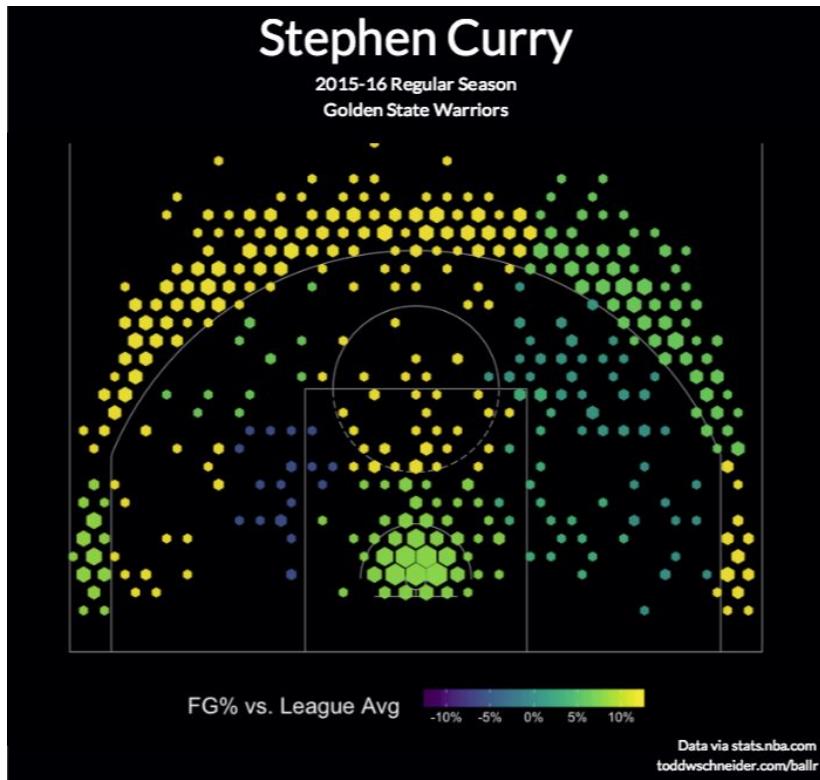

# Recap on Camera Calibrations

- Want to find a way to relate real world coordinates and image coordinates
- Do that with a matrix that transforms between points
- Let's build intuition from the ground up
- What's a domain where you might have an important and well defined real world coordinate system?

# Sports!

# Camera Calibration Underlies all Technology in Sports

# Let's Start With a Simple Problem

# Let's Start With a Simple Problem

Messi scored a goal from here. We have an image and want to know where he is

Object detector says he's at pixel value (300, 600).... that's not useful

# Now consider 3D

Now consider 3D

$$\mathbf{K} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix}$$

K is called the camera intrinsics

# Potential Issues?

# Potential Issues?

Real world coordinate system  
isn't aligned with camera  
coordinate system!

# Potential Issues?

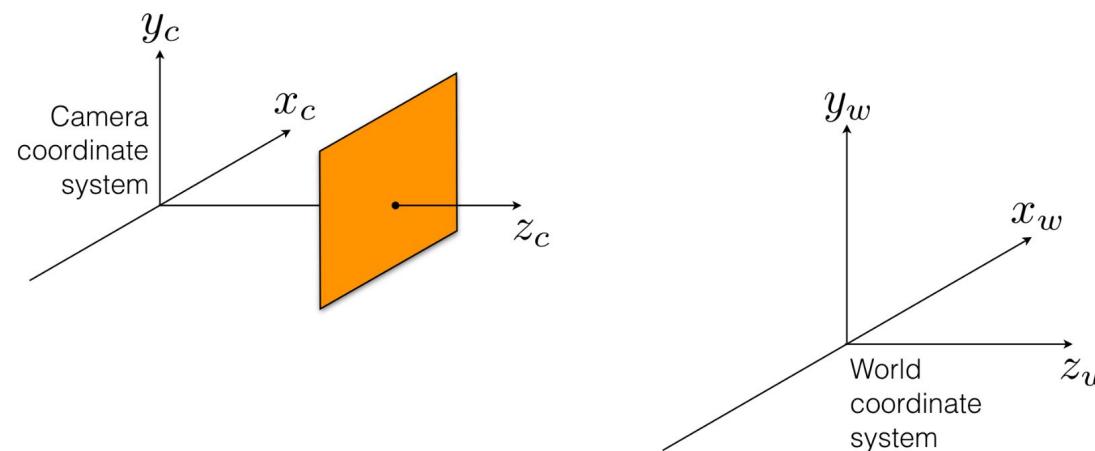

Real world coordinate system  
isn't aligned with camera  
coordinate system!

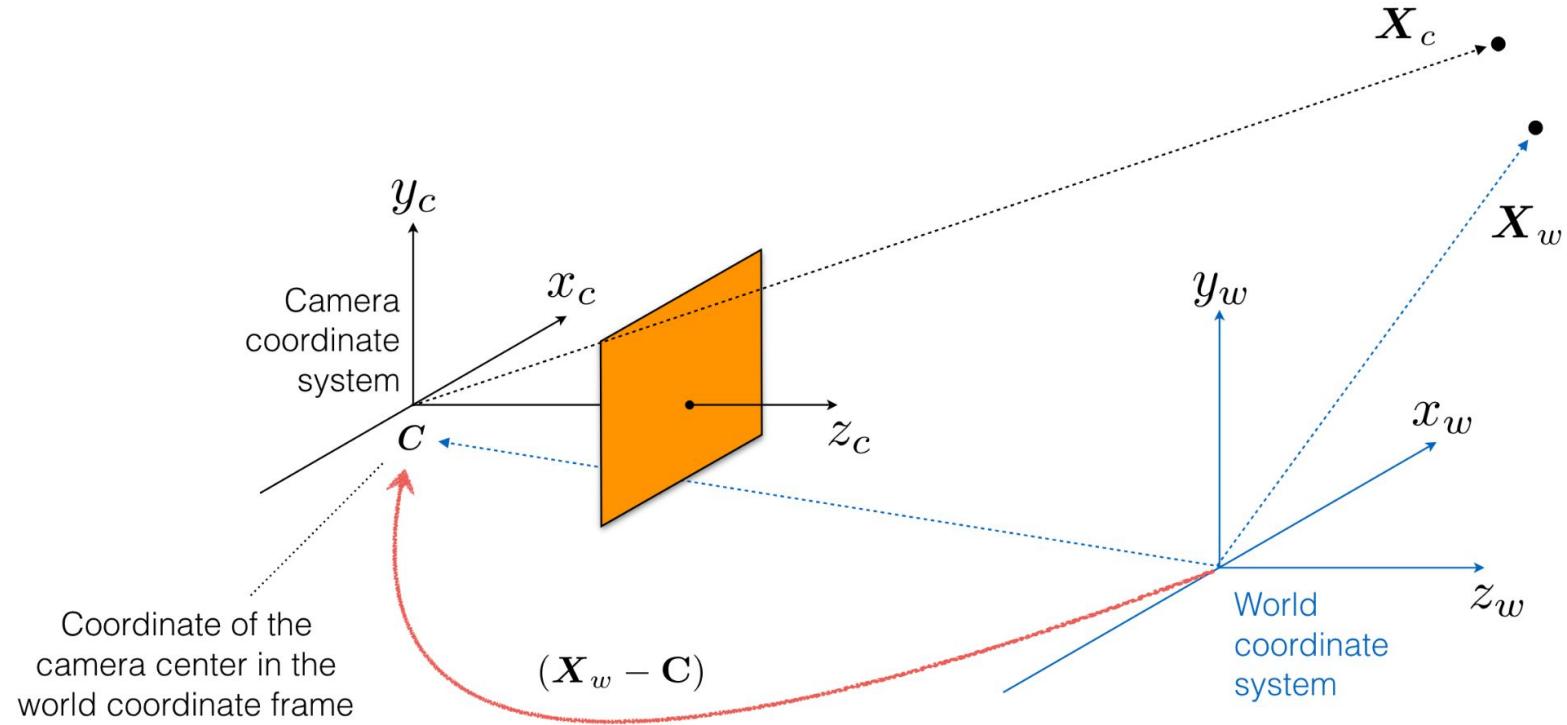

Assumes that the **camera** and **world**  
share the same coordinate system

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

*What if they are different?  
How do we align them?*

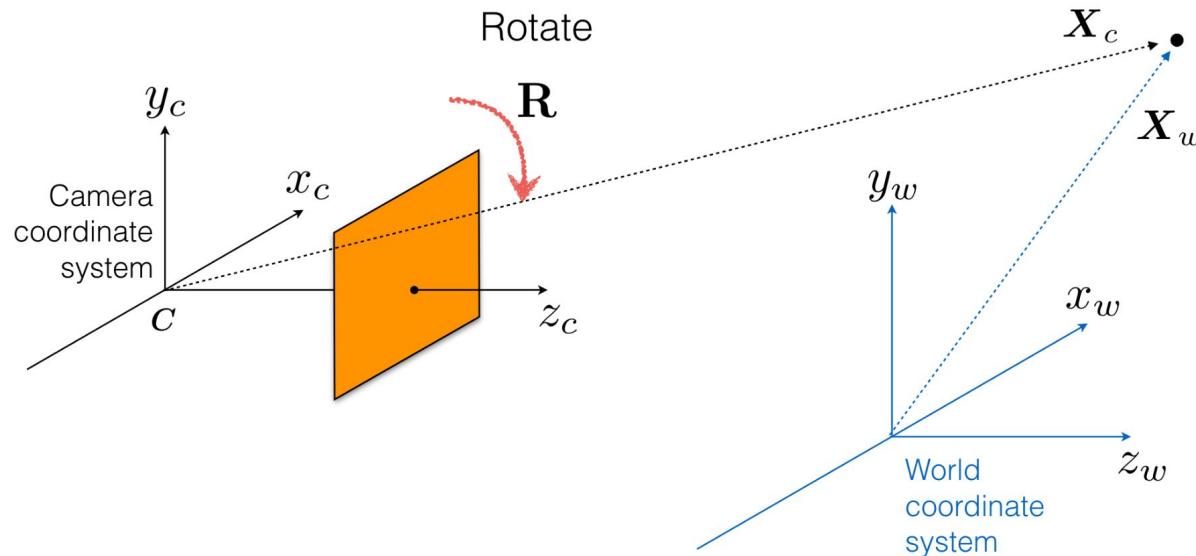

$$(\mathbf{X}_w - \mathbf{C})$$

Translate

[https://www.cs.cmu.edu/~16385/s17/Slides/11.1\\_Camera\\_matrix.pdf](https://www.cs.cmu.edu/~16385/s17/Slides/11.1_Camera_matrix.pdf)

## What happens to points after alignment?

$$\mathbf{R}(\mathbf{X}_w - \mathbf{C})$$

Rotate Translate

[https://www.cs.cmu.edu/~16385/s17/Slides/11.1\\_Camera\\_matrix.pdf](https://www.cs.cmu.edu/~16385/s17/Slides/11.1_Camera_matrix.pdf)

What is the meaning of each matrix of the camera matrix decomposition?

$$\mathbf{P} = \mathbf{K}\mathbf{R}[\mathbf{I}] - \mathbf{C}$$

3x3 intrinsics      3x3 3D rotation      3x3 identity      3x1 3D translation

# The story so far

- Model the 3D-to-2D camera projection:  $\tilde{\mathbf{x}}^I \sim \mathbf{P} \tilde{\mathbf{X}}^W$  with  $\mathbf{P} = \mathbf{K}[\mathbf{R}|\mathbf{t}]$
- Calibrate cameras (get  $\mathbf{K}[\mathbf{R}|\mathbf{t}]$ ) from N 2D-**3D** correspondences ( $\tilde{\mathbf{x}}_i^I$ ,  $\tilde{\mathbf{X}}_i^W$ )
- cast constraints (2D-3D correspondences) as a linear system  $\mathbf{A} \mathbf{p} = \mathbf{0}$
  - total least squares ( $\text{argmin}_{\mathbf{x}} \|\mathbf{A} \mathbf{p}\|^2$  s.t.  $\|\mathbf{p}\|^2 = 1$ ) gives the best approximation
  - closed-form solution via the SVD of  $\mathbf{A}$  (its last right singular vector) & Cholesky
  - refine by minimizing the 2D reprojection error  $\sum_i \|\text{proj}(\mathbf{K}[\mathbf{R} | \mathbf{t}] \mathbf{X}_i; \mathbf{k}) - \mathbf{x}_i\|^2$

# Quiz

- Why do we project real world 3D points to image points and not the other way?
- Does a point in an image define a unique 3D point? What does it define?
- What additional information could you use to know the unique 3D point corresponding to an image?

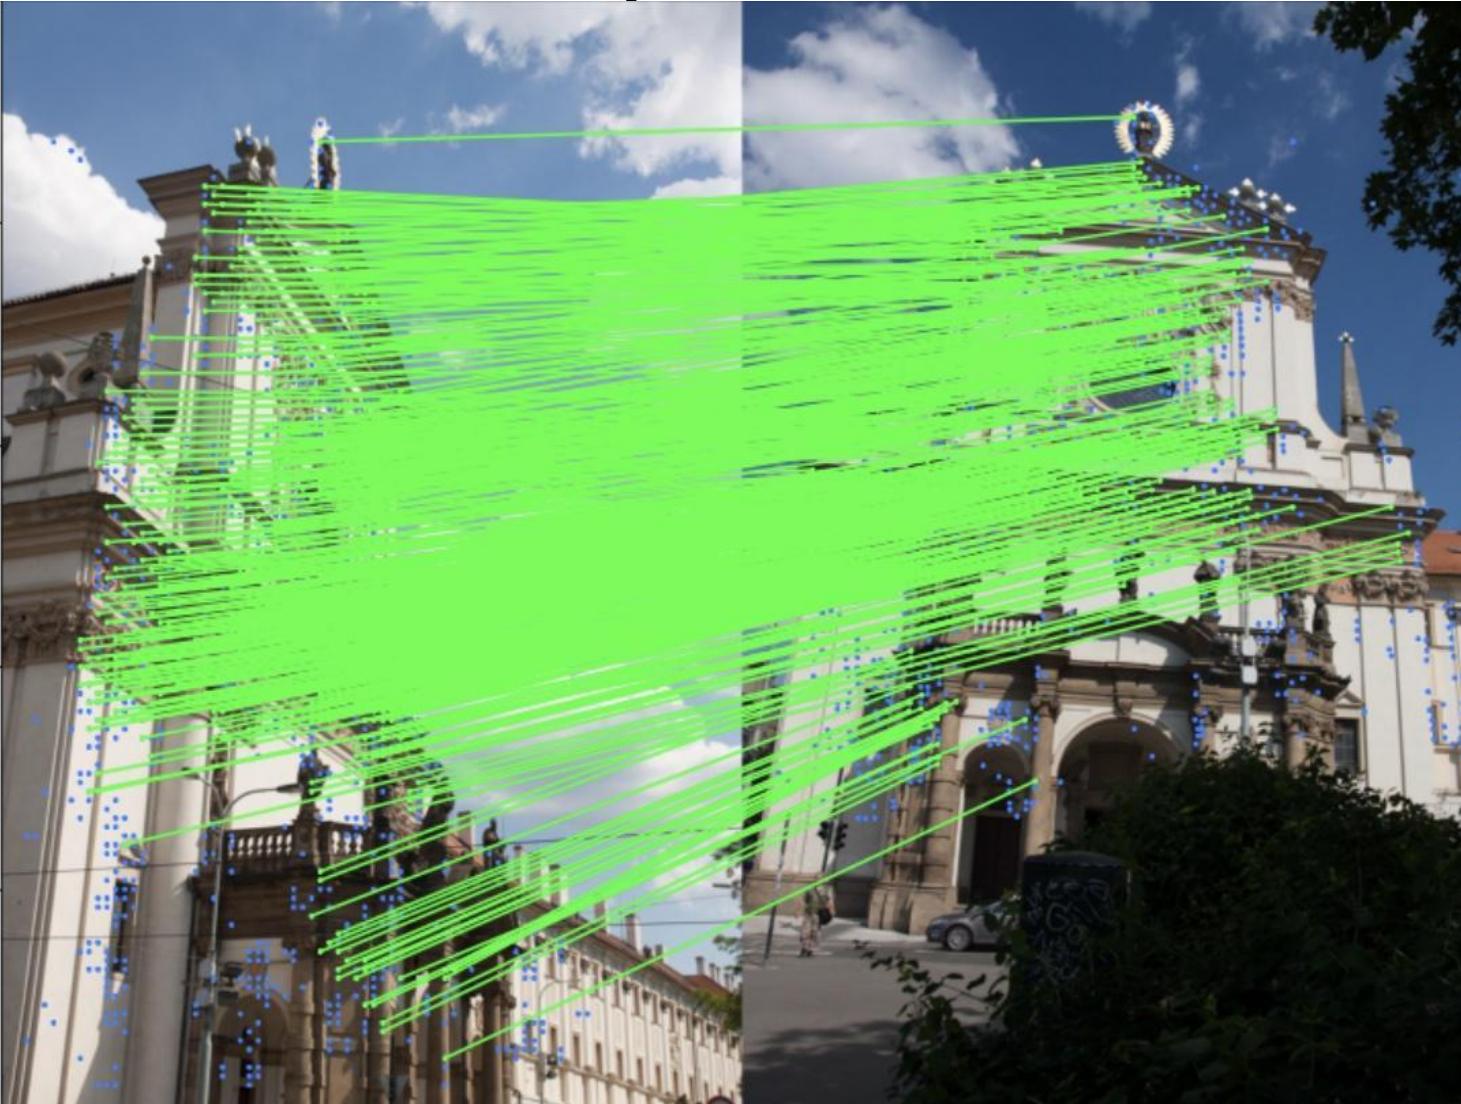

In general, we don't have **3D** measurements...

... but more than 1 image!

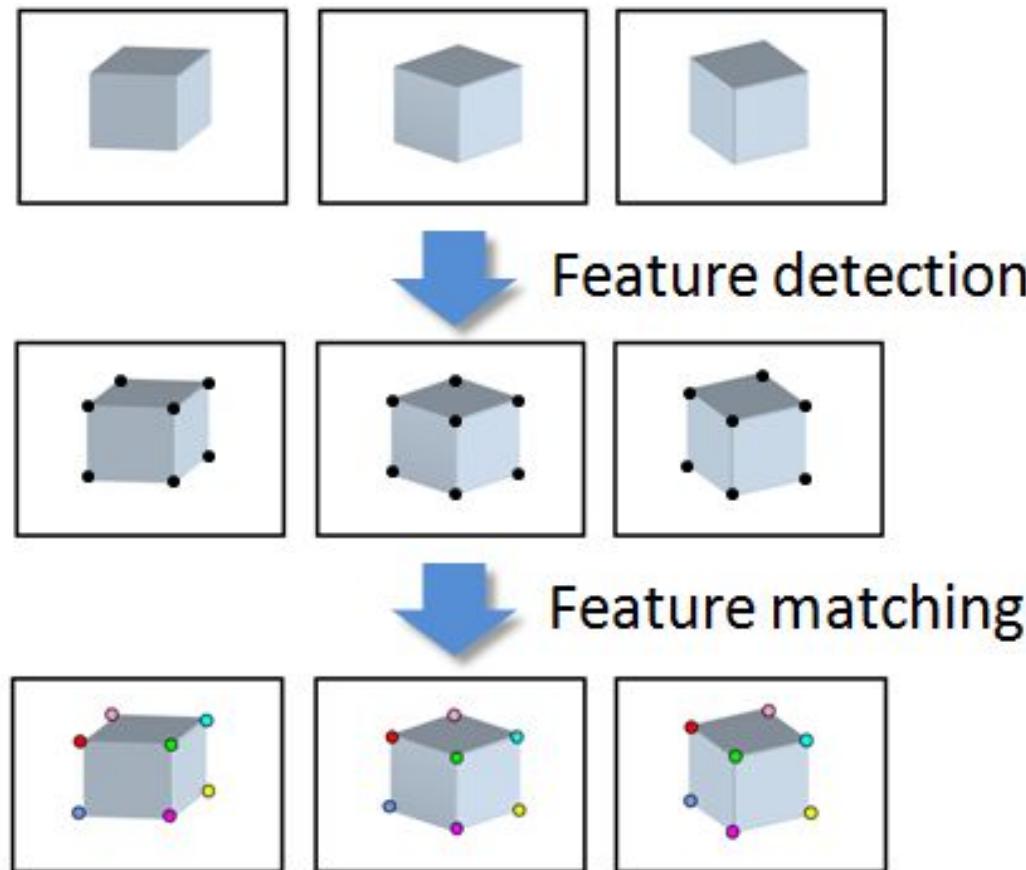

What are the geometric constraints governing  
**multiple views** of the same scene?

**2D correspondences!**

# Get 3D structure & motion from 2D correspondences

# What will we learn today?

Triangulation

Epipolar geometry

Stereo

Structure-from-Motion (SfM)

# Triangulation

Given projections of a 3D point in two or more images (with known camera matrices), find the coordinates of the point

# Triangulation

Given projections of a 3D point in two or more images (with known camera matrices), find the coordinates of the point

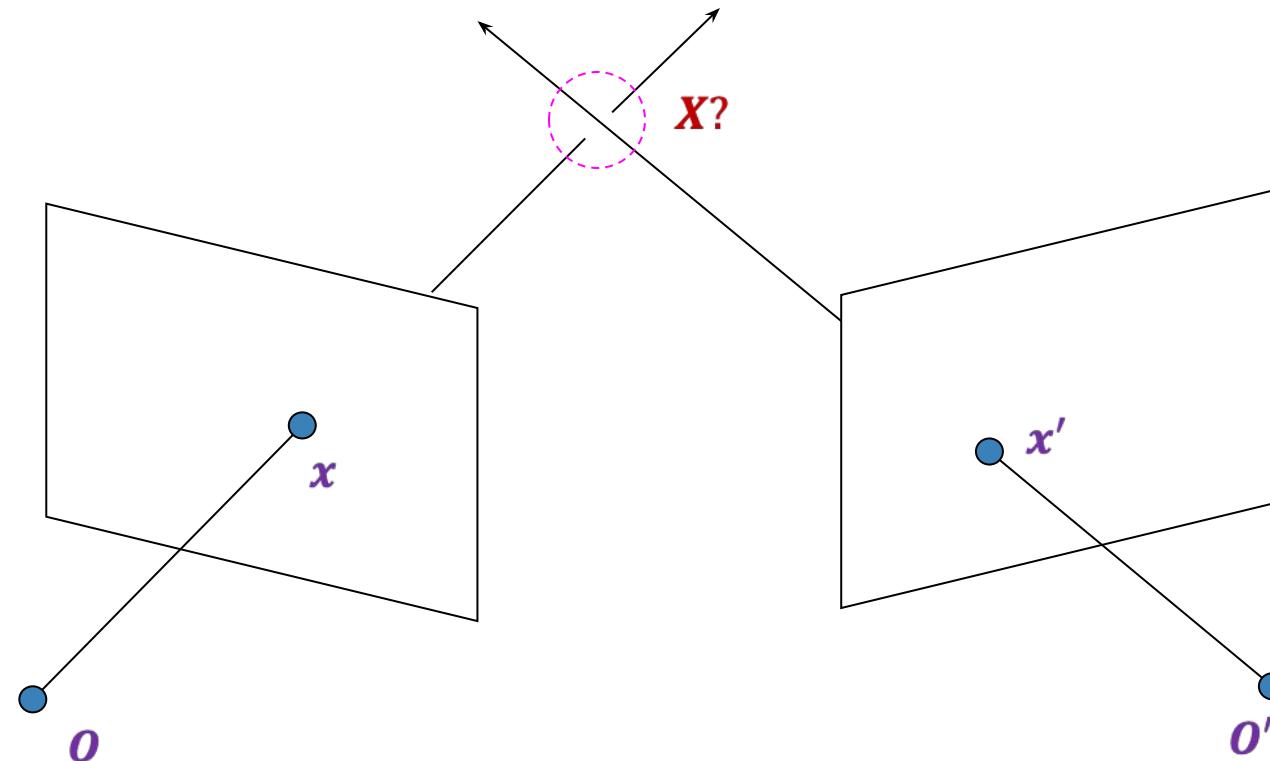

# Triangulation

We want to intersect the two visual rays corresponding to  $x$  and  $x'$

But do they always intersect *exactly*?

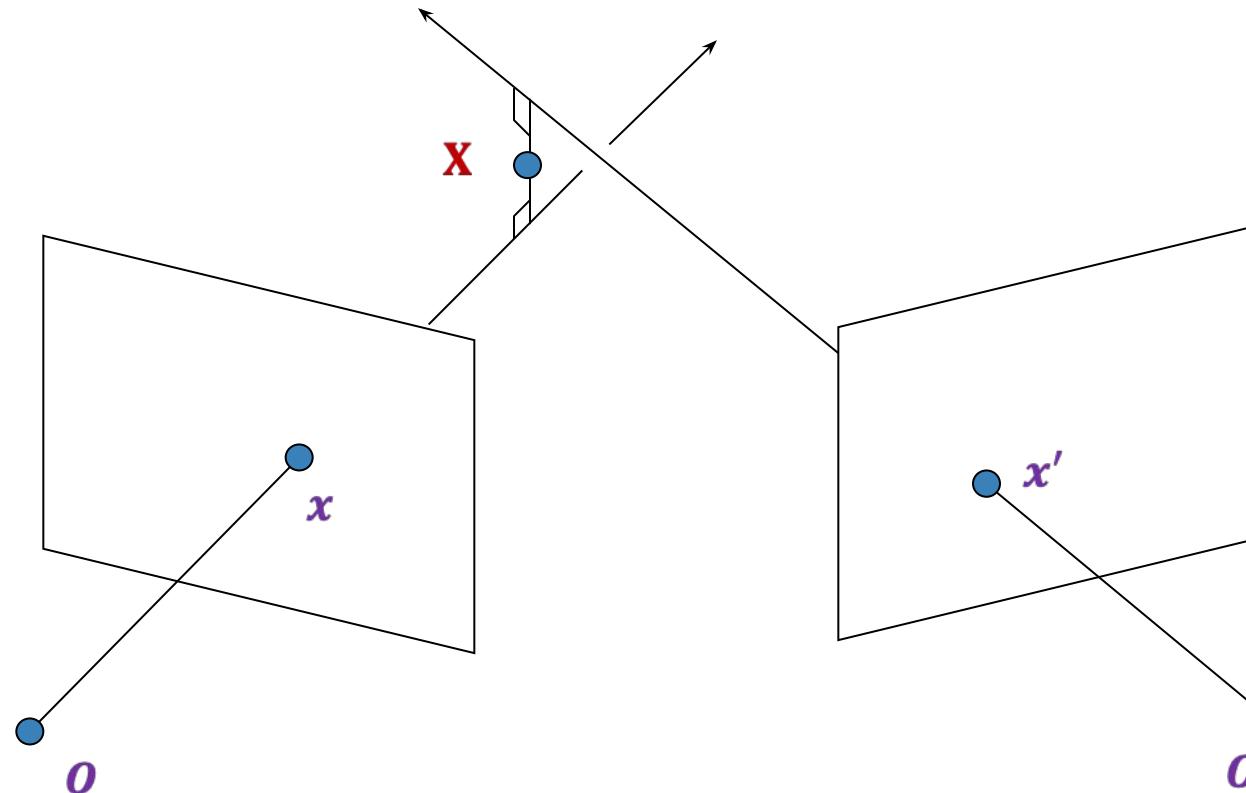

No! Noise in 2D matching or numerical errors

# Triangulation: linear approach

Find the shortest segment connecting the two viewing rays

Let  $\mathbf{X}$  be the midpoint of that segment: solve for  $\mathbf{X}$ !

what is  $\mathbf{A}$ ?

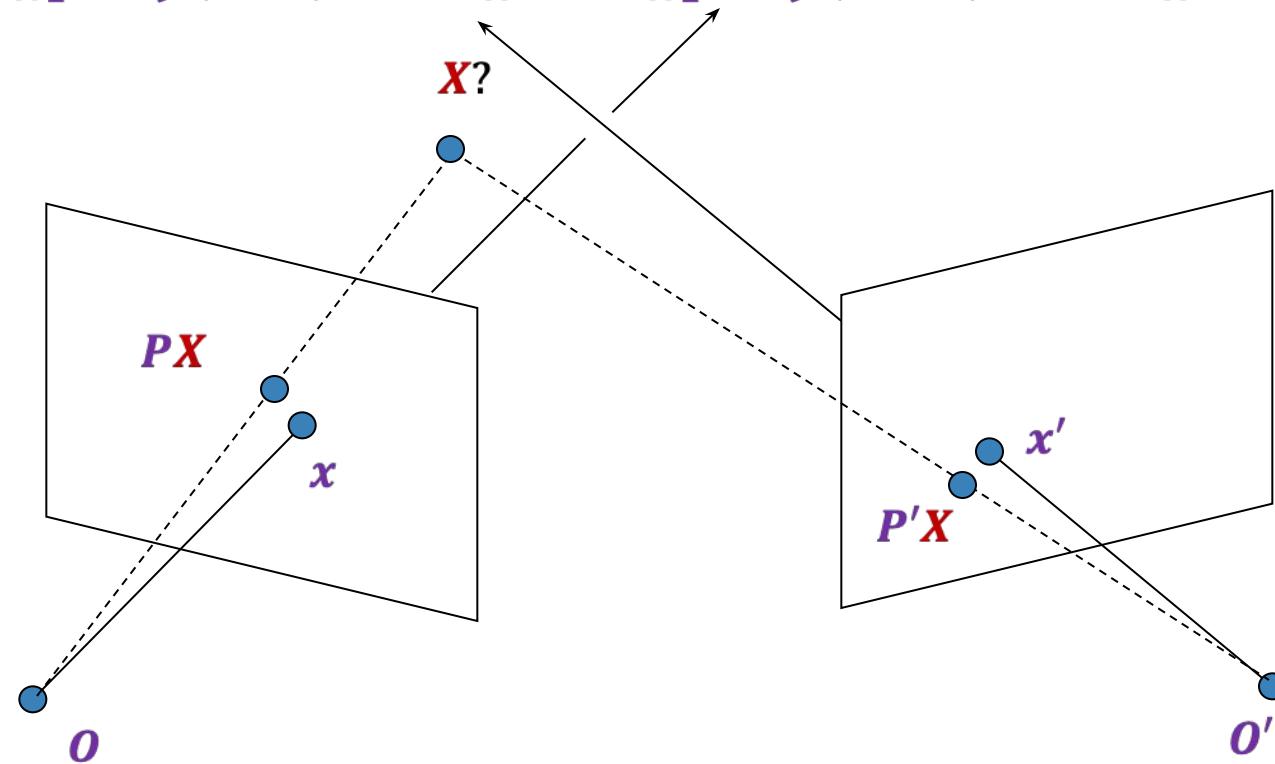

(answer in appendix)

As for calibration: constraints  $(\mathbf{x} \sim \mathbf{P}\mathbf{X}, \mathbf{x}' \sim \mathbf{P}'\mathbf{X}) \rightarrow \mathbf{A}\mathbf{X} = \mathbf{0} \rightarrow$  SVD of  $\mathbf{A}$

# Triangulation: *non-linear* approach

- Find  $\mathbf{X}$  that minimizes the 2D reprojection errors

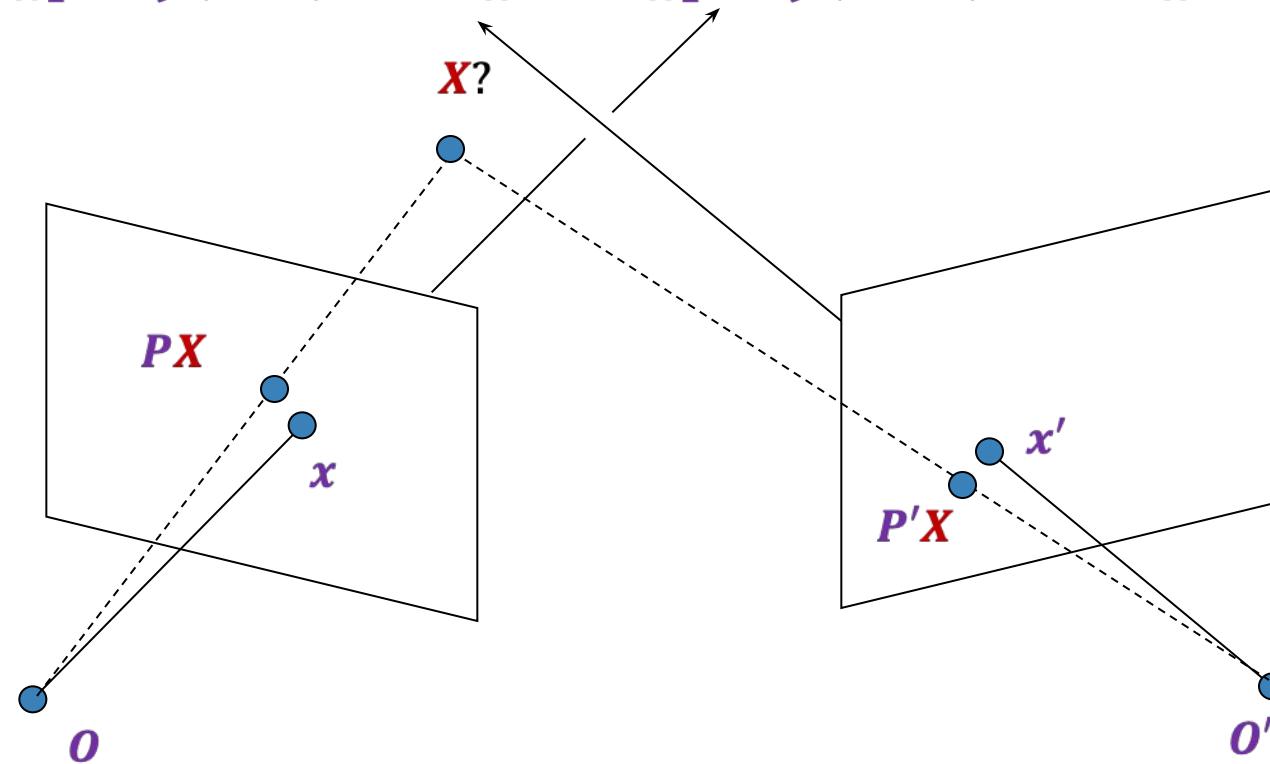

$$\|\text{proj}(\mathbf{P}\mathbf{X}) - \mathbf{x}\|^2 + \|\text{proj}(\mathbf{P}'\mathbf{X}) - \mathbf{x}'\|^2$$

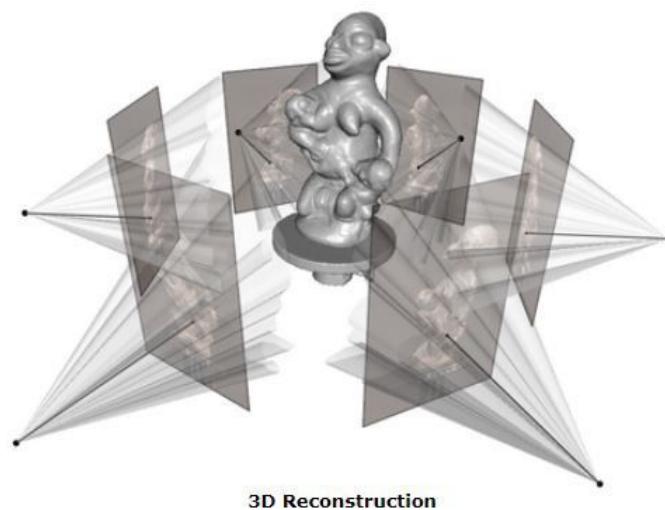

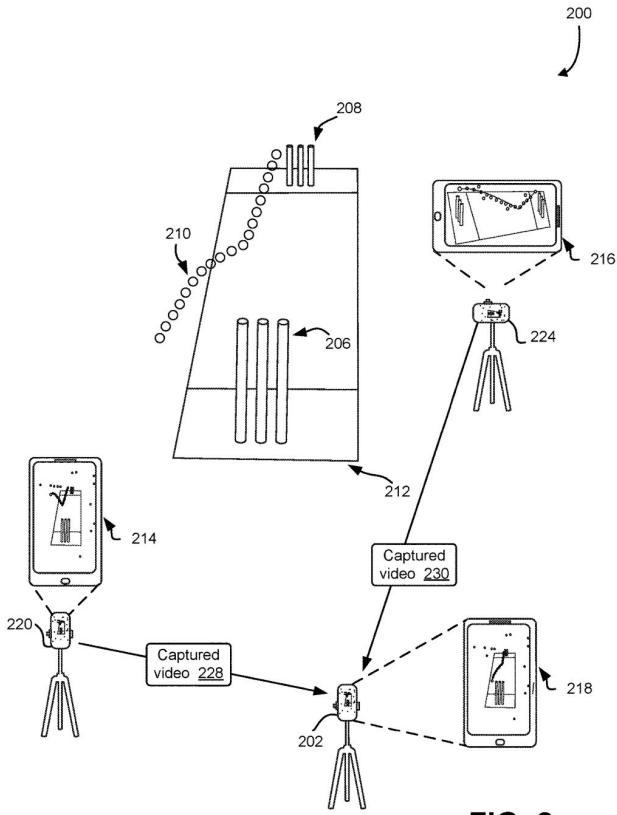

# Triangulation: *non-linear* approach

- Find  $\mathbf{X}$  that minimizes the 2D reprojection errors

$$\|\text{proj}(\mathbf{P}\mathbf{X}) - \mathbf{x}\|^2 + \|\text{proj}(\mathbf{P}'\mathbf{X}) - \mathbf{x}'\|^2$$

# Applications of Triangulation

# What will we learn today?

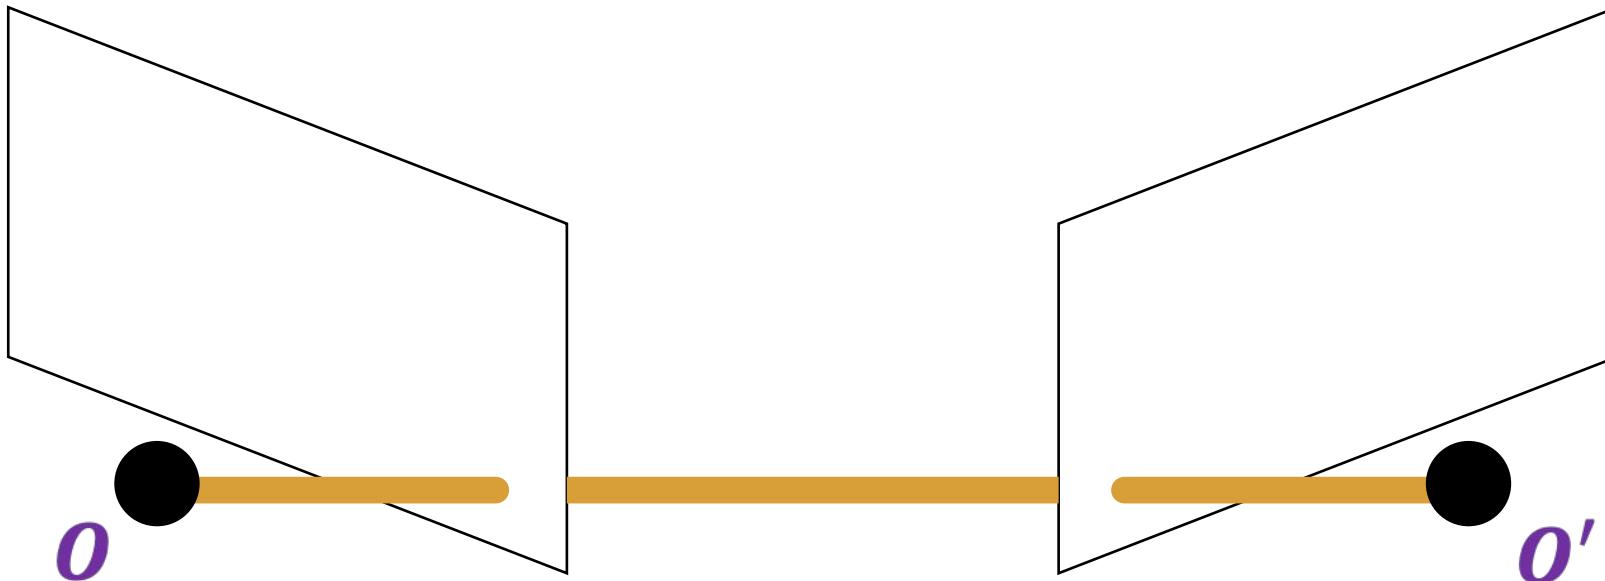

Triangulation

Epipolar geometry

Stereo

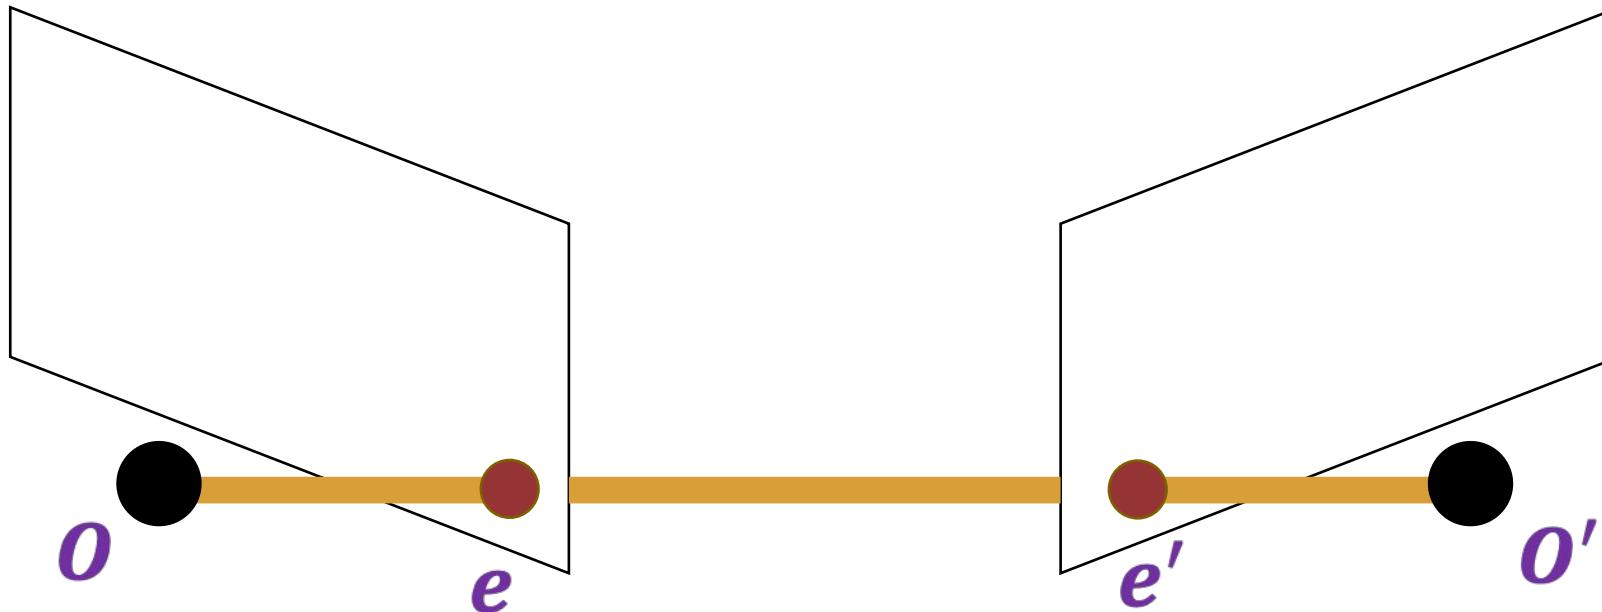

Structure-from-Motion (SfM)

# Epipolar geometry setup

- Suppose we have two cameras with centers  $o, o'$
- The **baseline** is the line connecting the origins

# Epipolar geometry setup

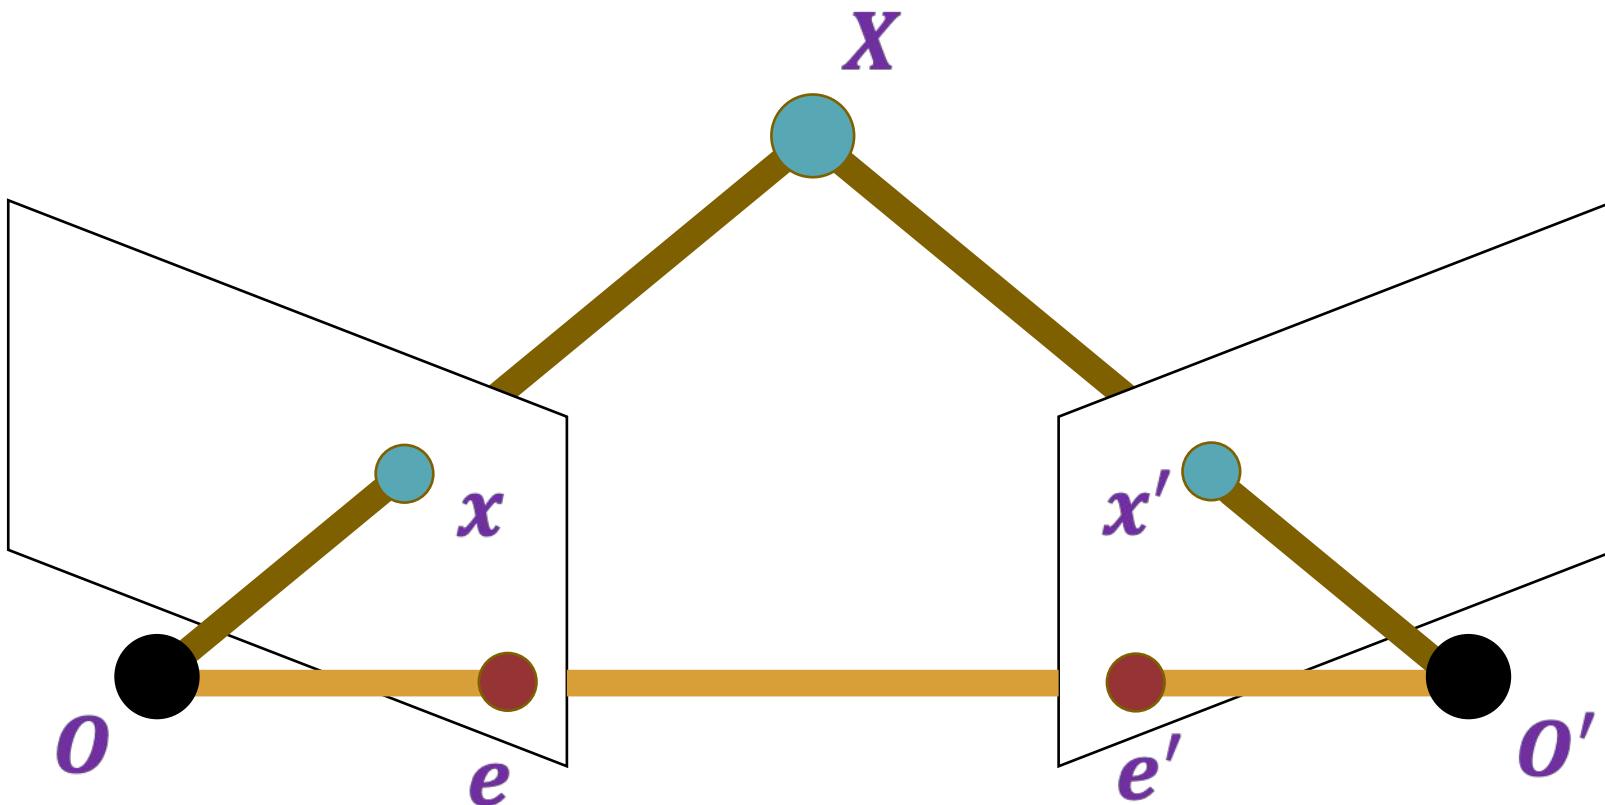

- **Epipoles**  $e, e'$  are where the baseline intersects the image planes
- Equivalently: epipoles are projections of the other camera in each view

# Epipolar geometry setup

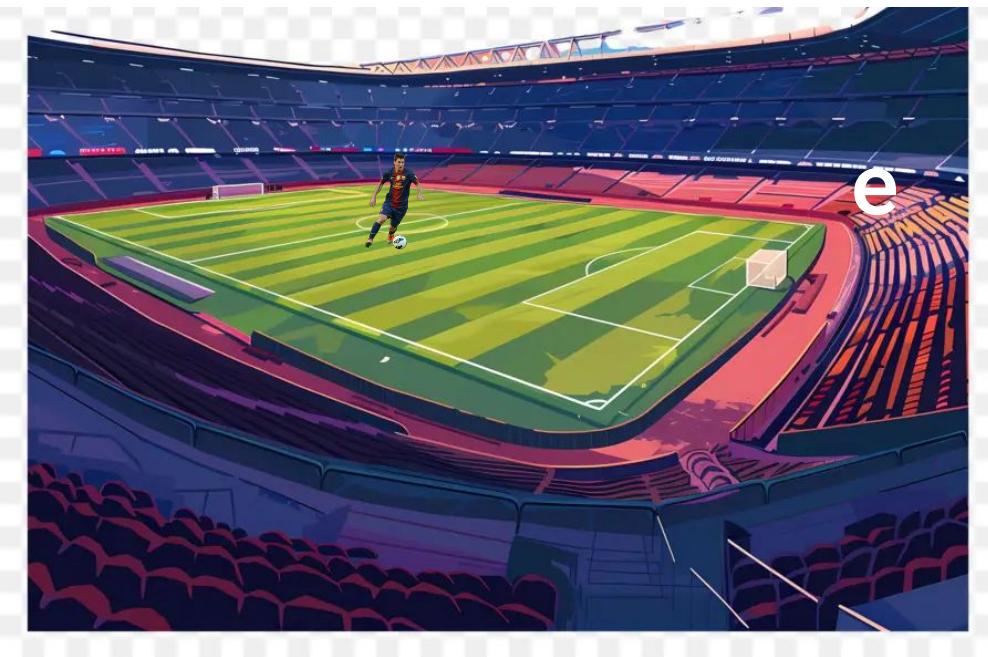

# Epipolar geometry setup

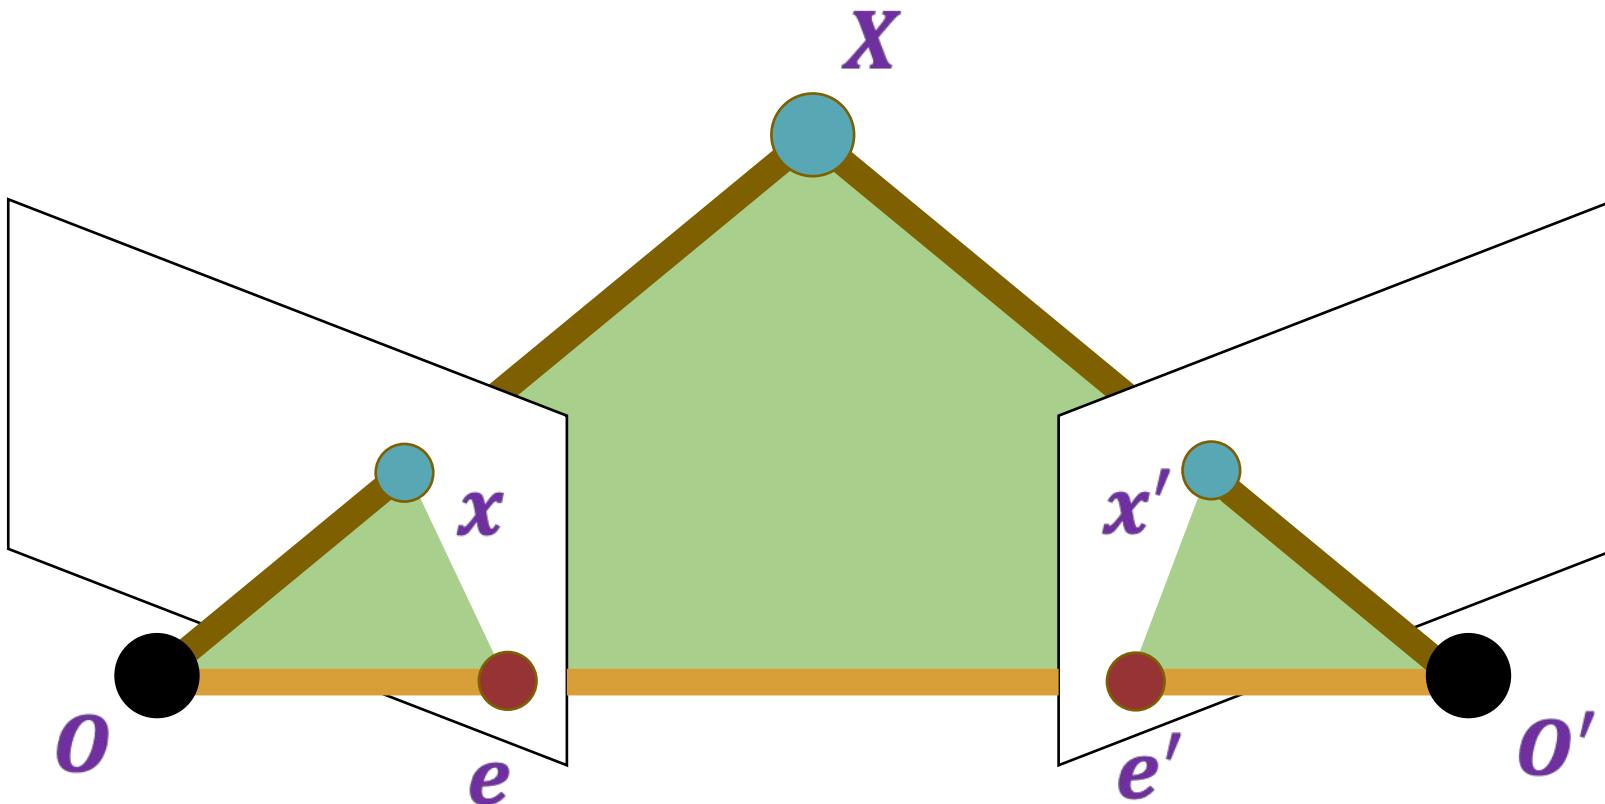

- Consider a **point  $X$** , which projects to  $x$  and  $x'$

# Epipolar geometry setup

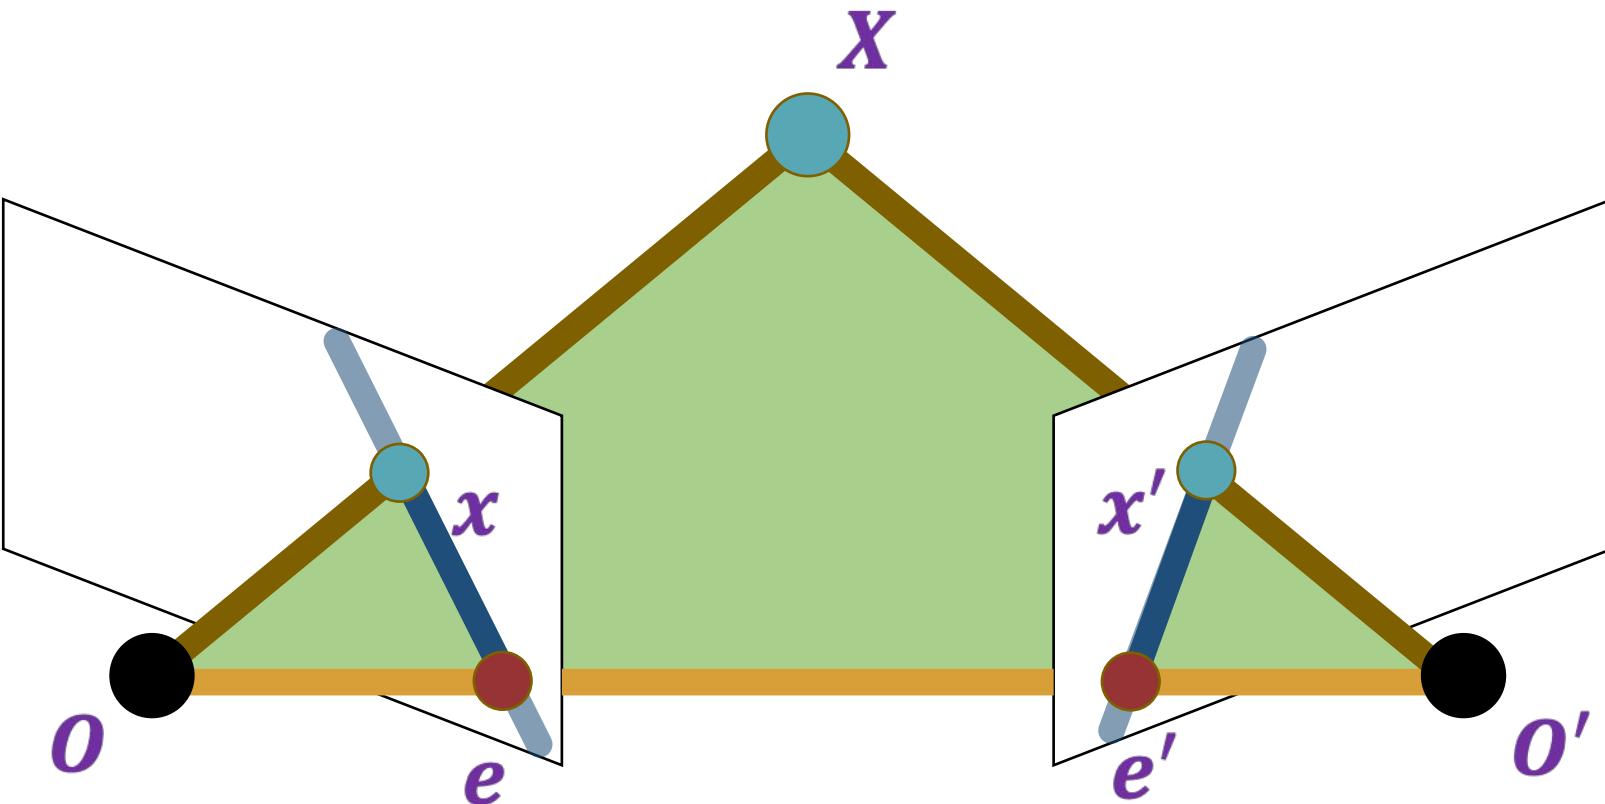

# Epipolar geometry setup

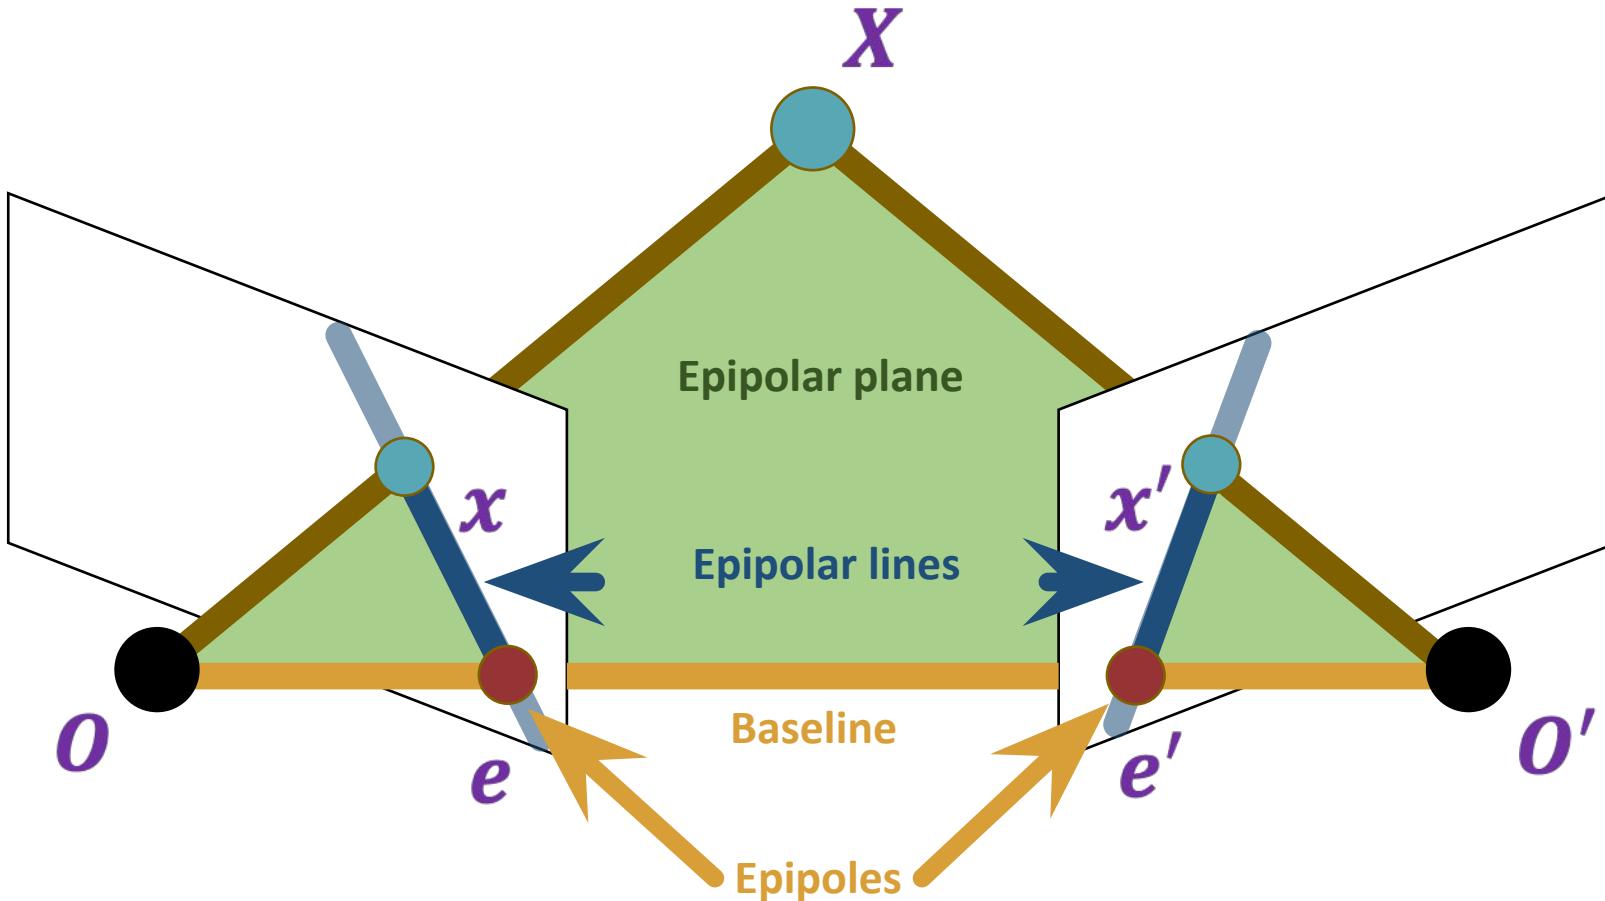

- The plane formed by  $\mathbf{X}$ ,  $\mathbf{o}$ , and  $\mathbf{o}'$  is called an **epipolar plane**

# Epipolar geometry setup

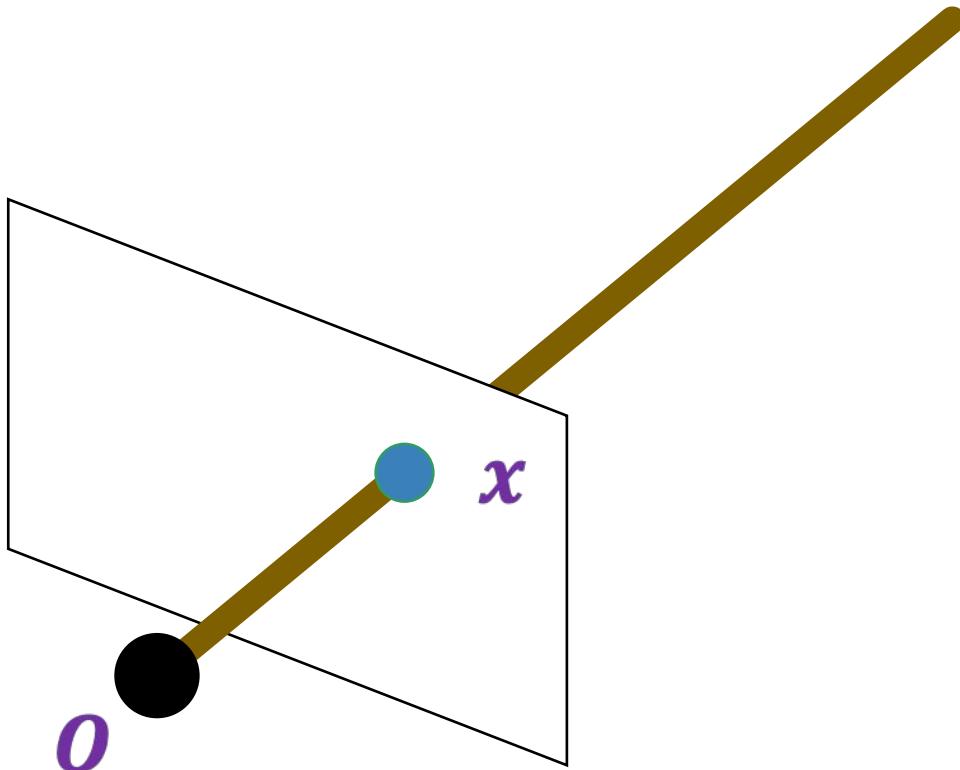

- **Epipolar lines** connect the epipoles to the projections of  $X$
- Equivalently, they are intersections of the epipolar plane with the image planes, come in pairs (for  $x$  and  $x'$ )

# Epipolar geometry setup: Summary

# Epipolar constraint

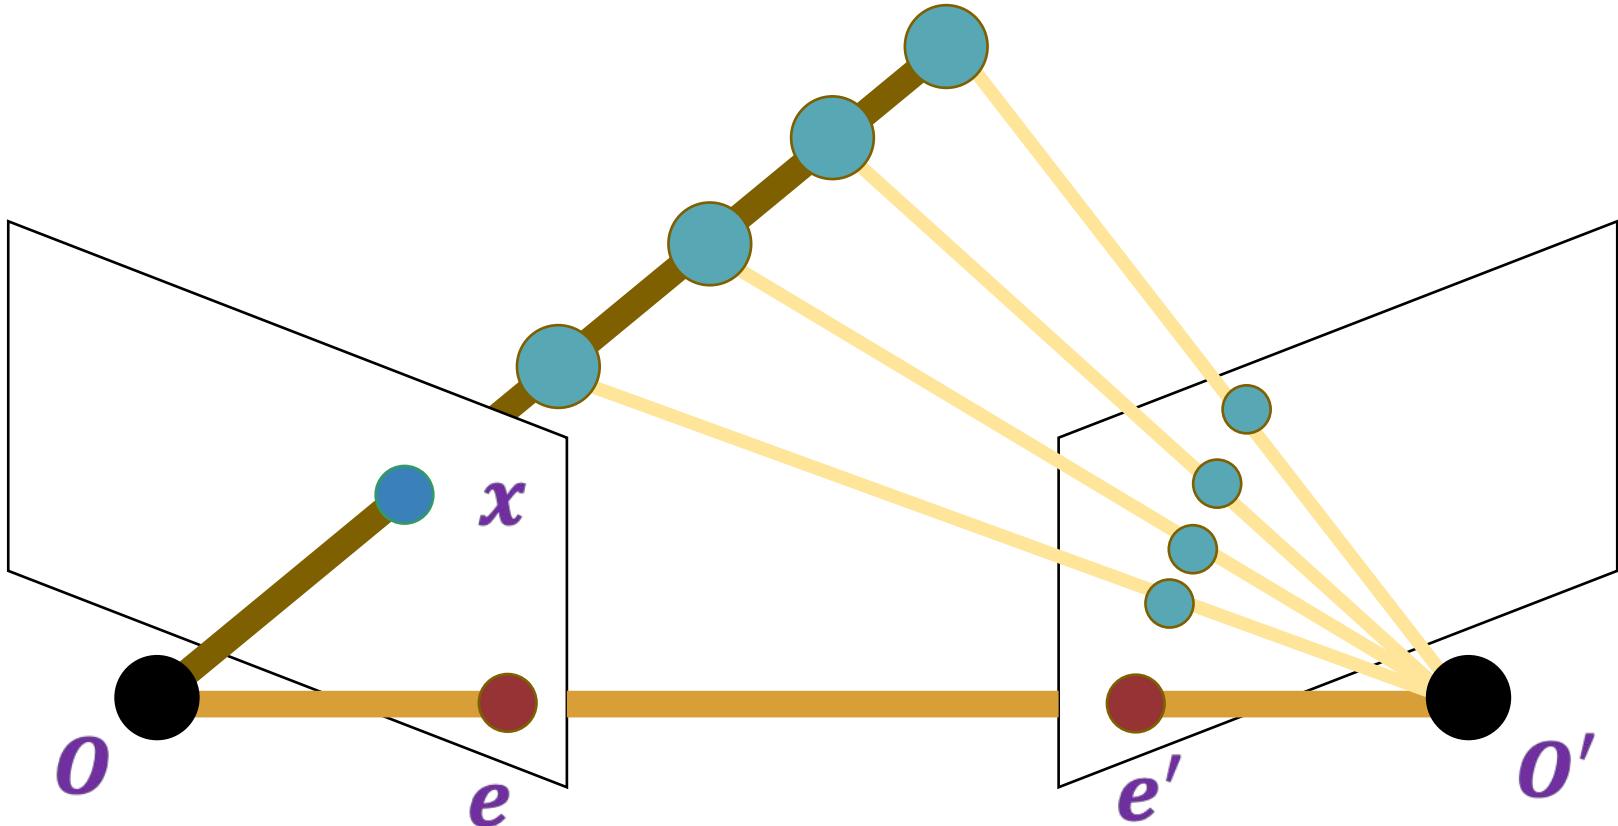

- Suppose we observe a single point  $x$  in one image

# Epipolar geometry setup

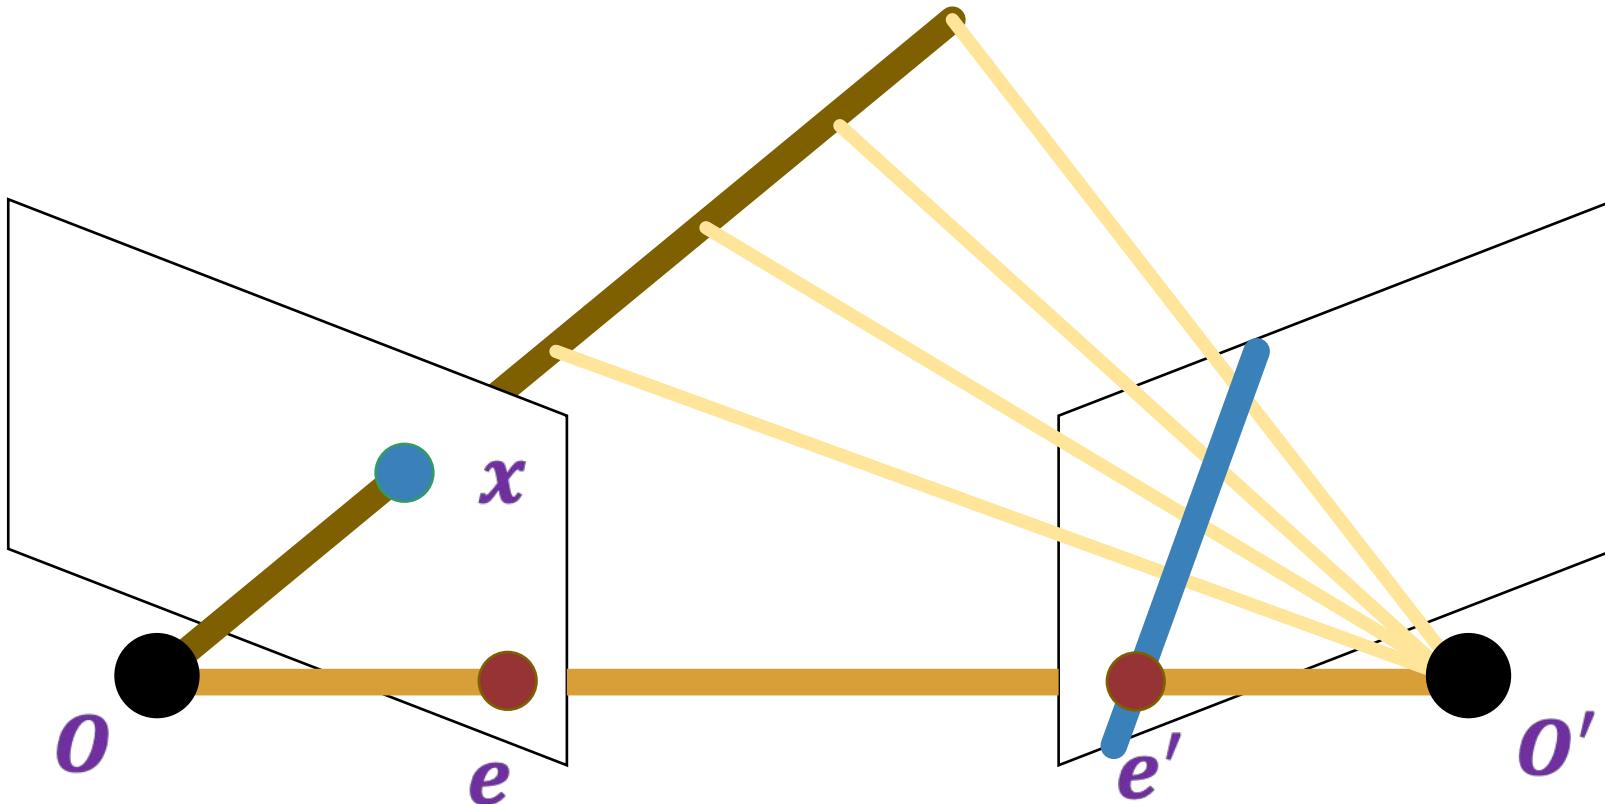

# Epipolar constraint

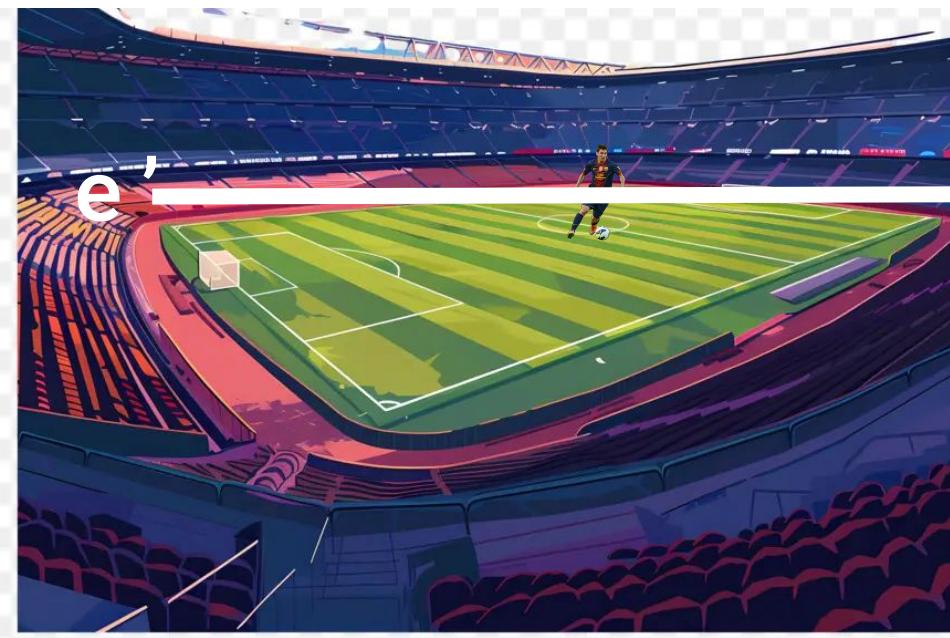

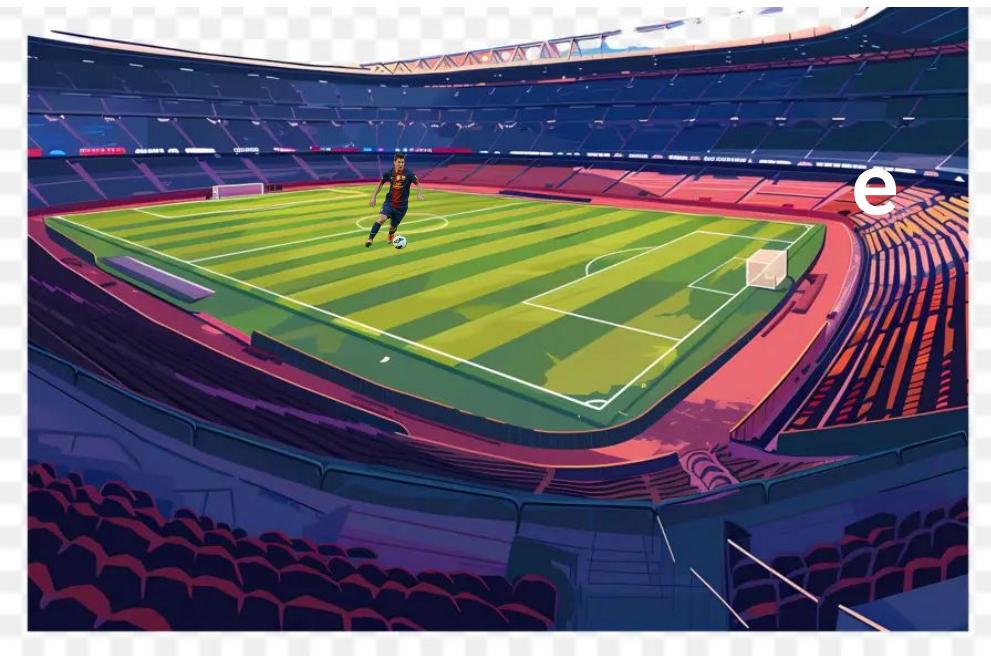

- Where can we find the  $x'$  corresponding to  $x$  in the other image?

# Epipolar constraint

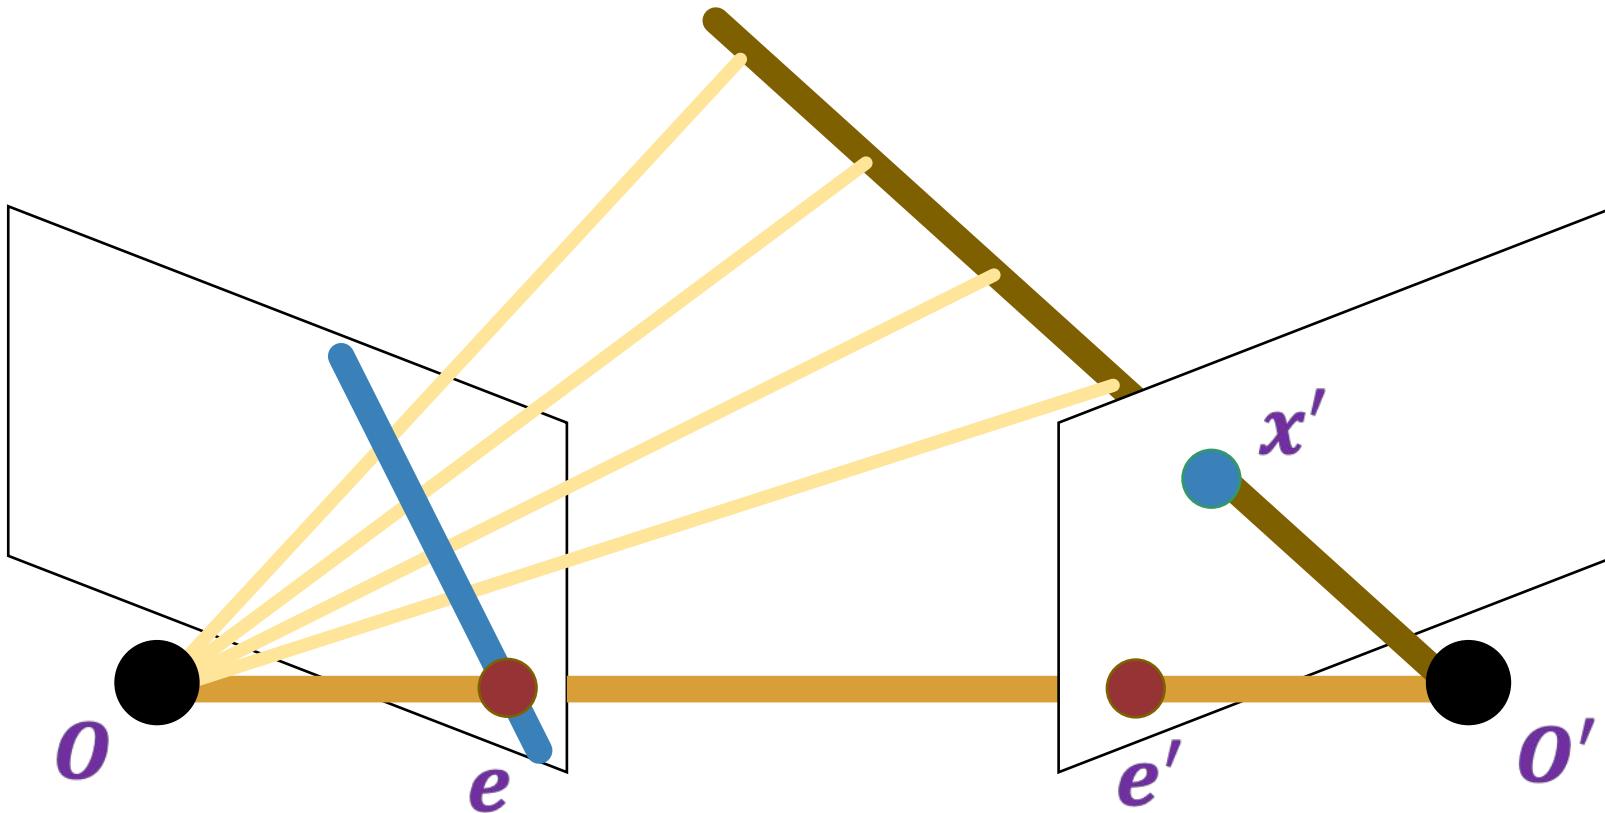

- Where can we find the  $x'$  corresponding to  $x$  in the other image?
- Along the **epipolar line** corresponding to  $x$  (projection of visual ray connecting  $o$  with  $x$  into the second image plane)

# Epipolar geometry setup

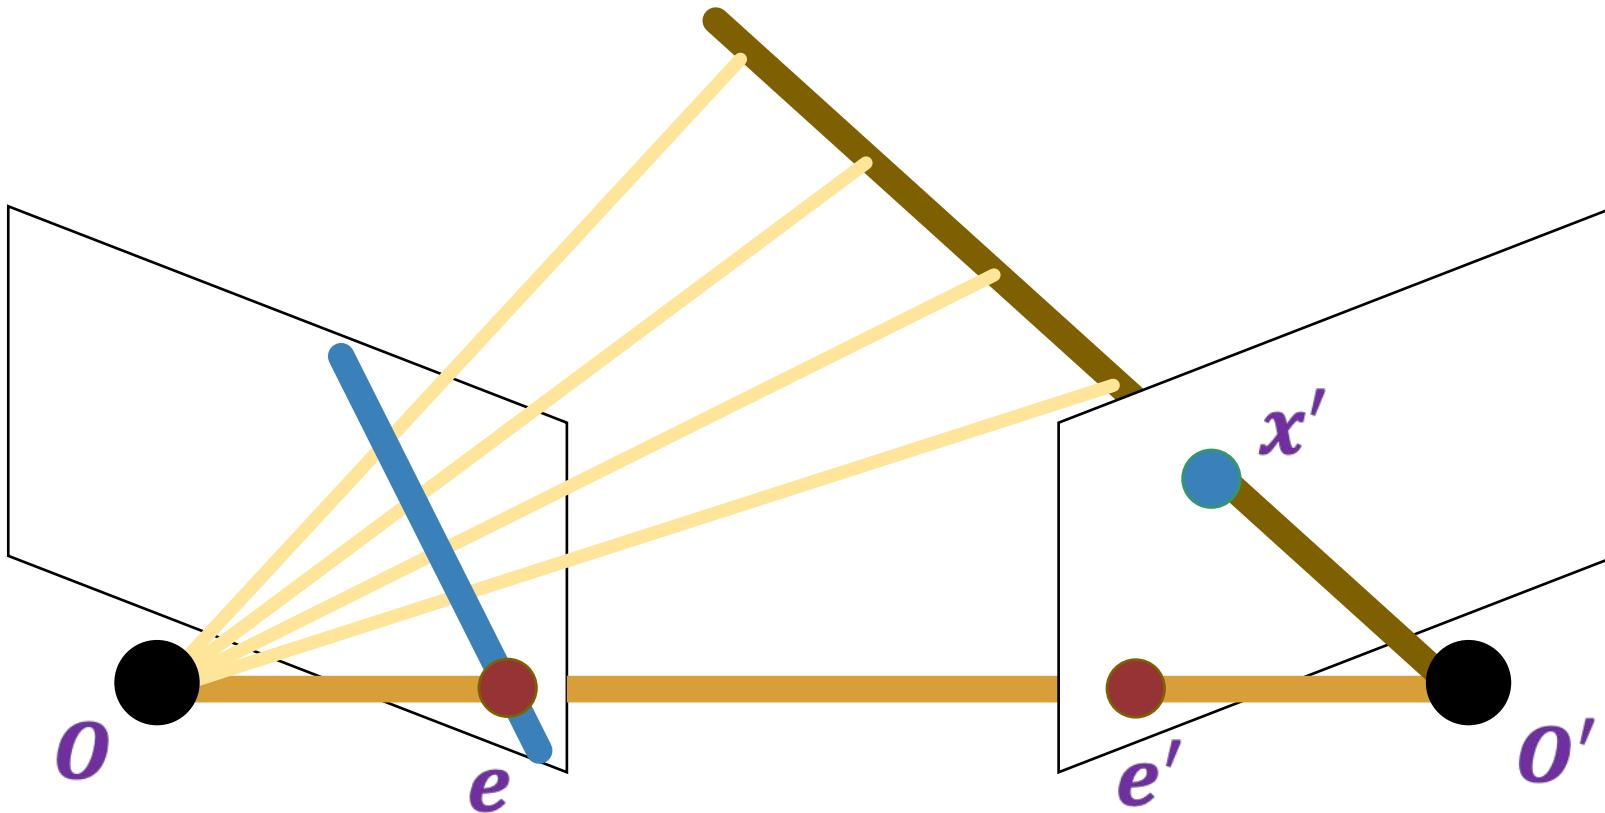

# Epipolar constraint

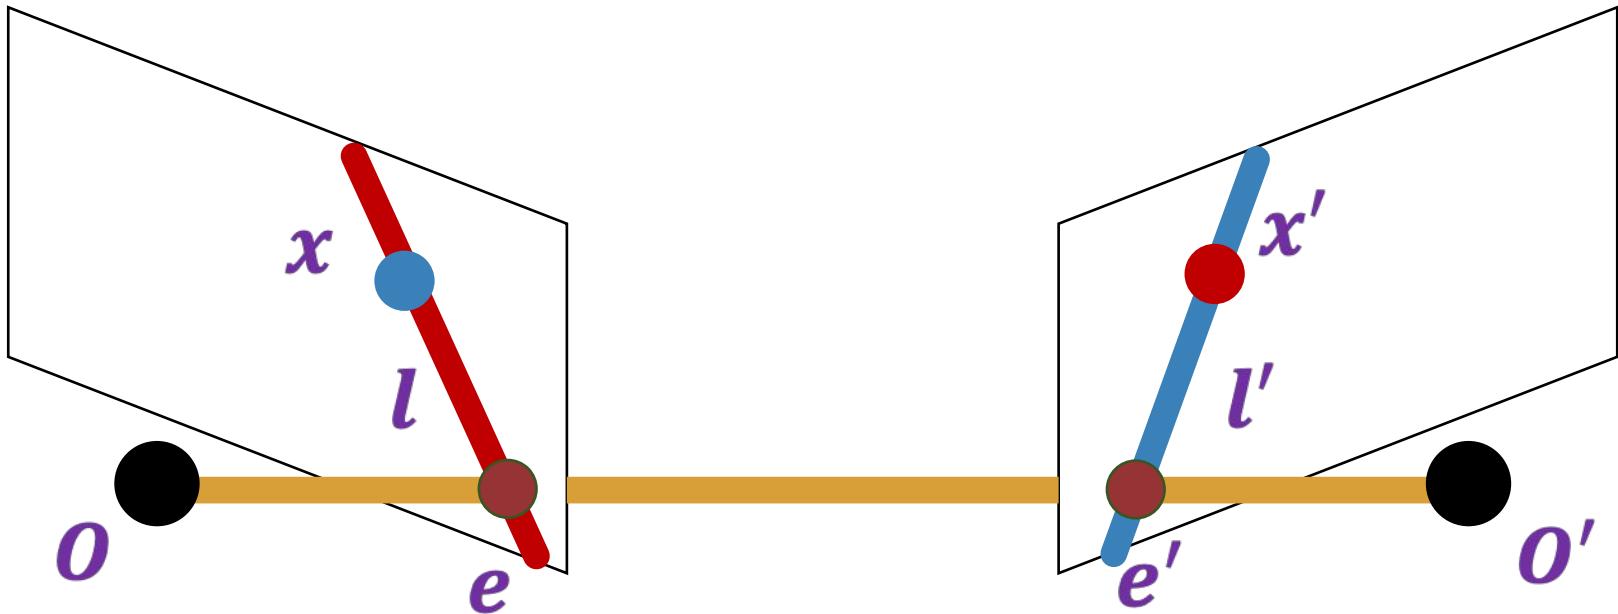

- Similarly, all points in the left image corresponding to  $x'$  have to lie along the epipolar line corresponding to  $x'$

# Epipolar constraint

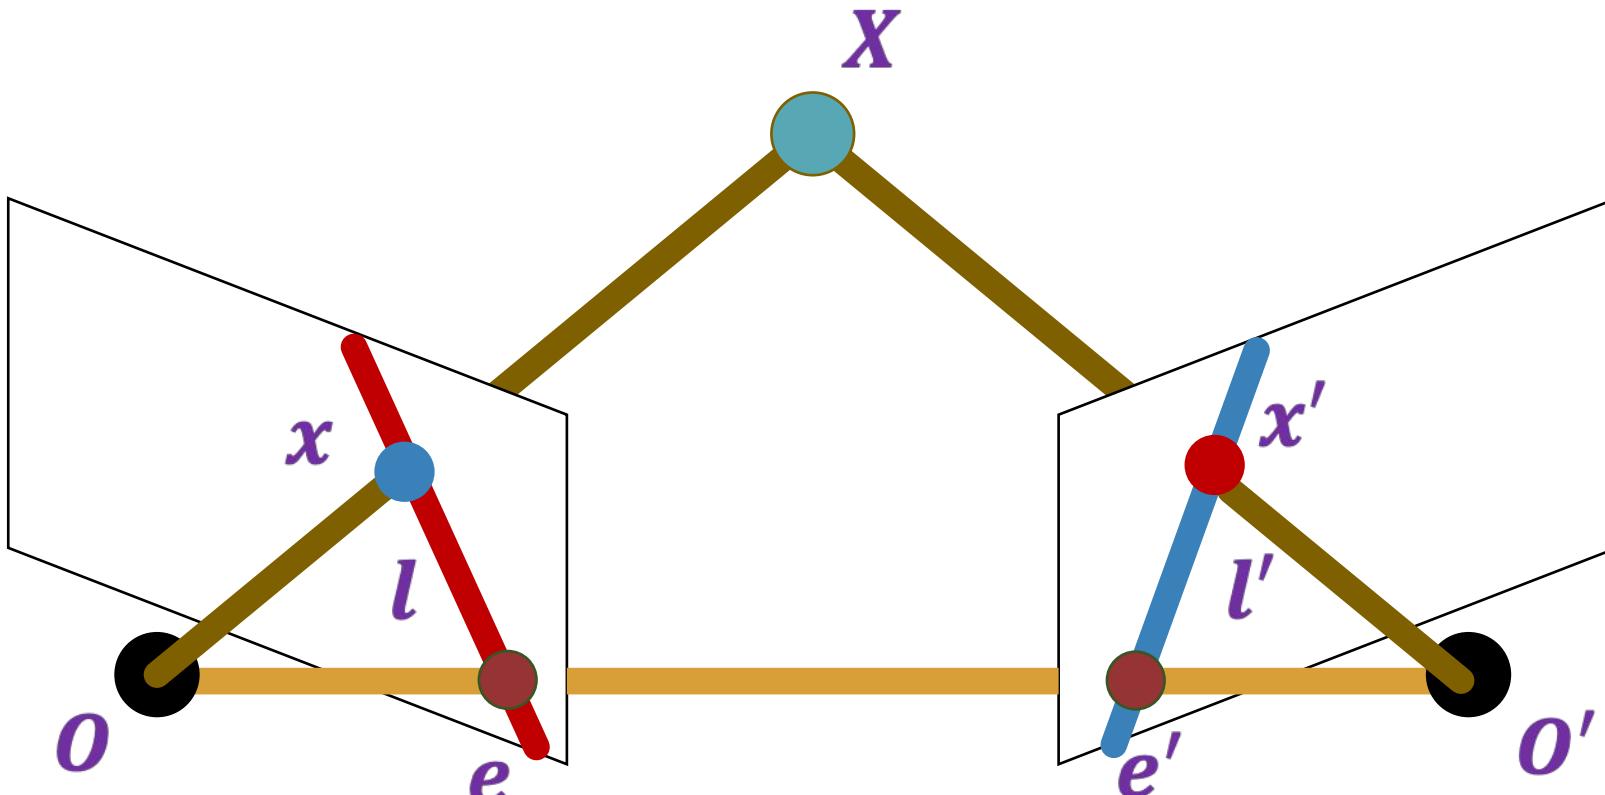

- Similarly, all points in the left image corresponding to  $x'$  have to lie along the epipolar line corresponding to  $x'$

# Epipolar constraint

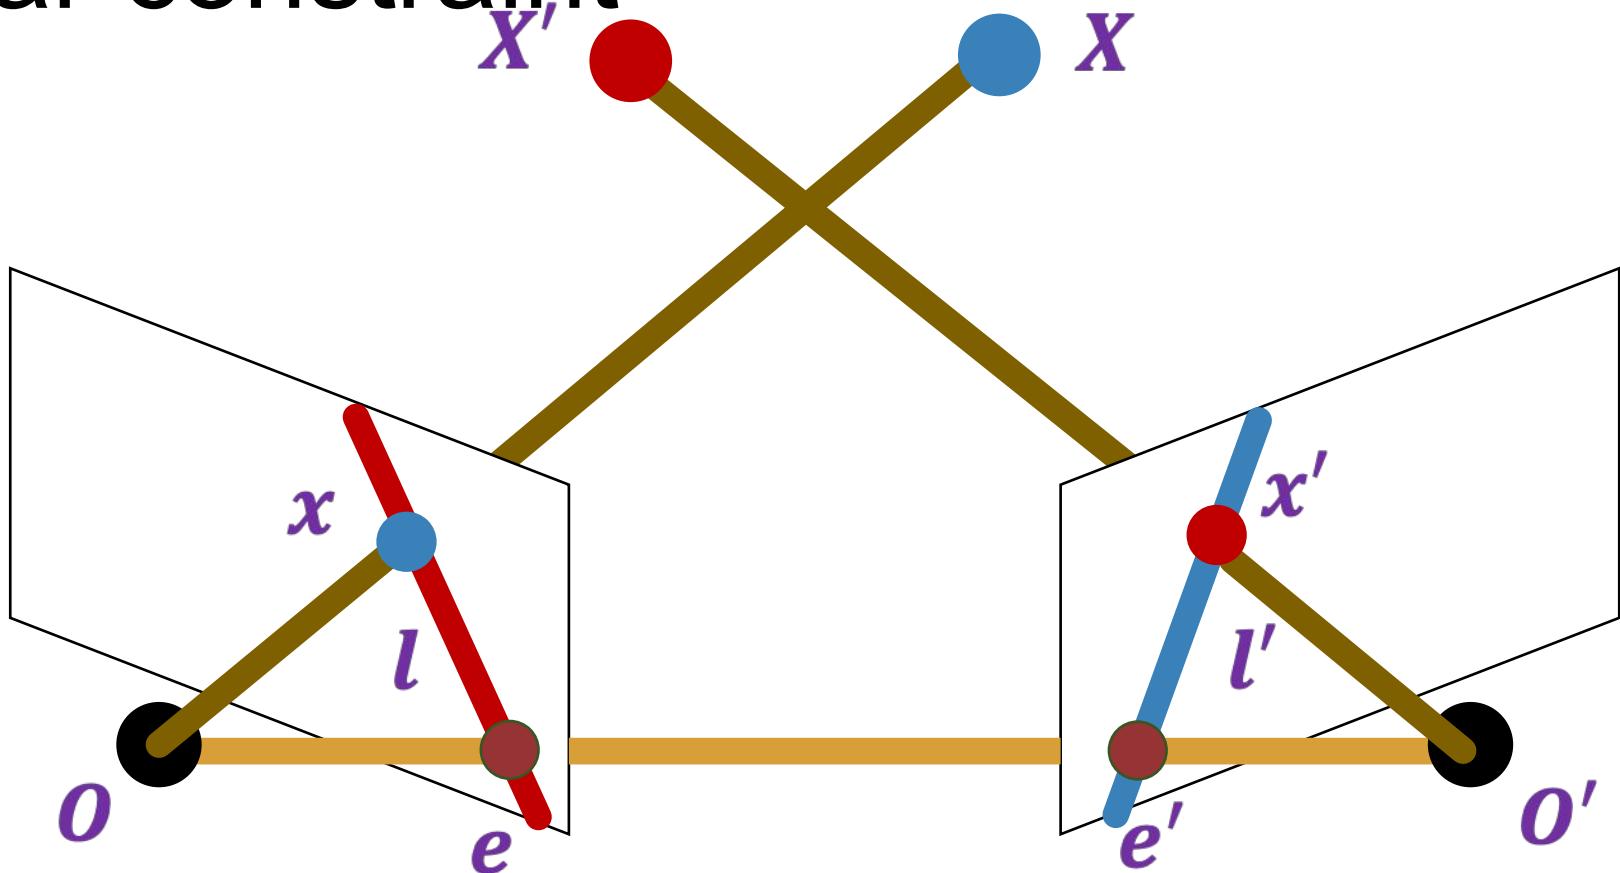

- Potential matches for  $x$  have to lie on the matching epipolar line  $l'$  and vice-versa → need only to search along 1D epipolar line for matching!

# Epipolar constraint

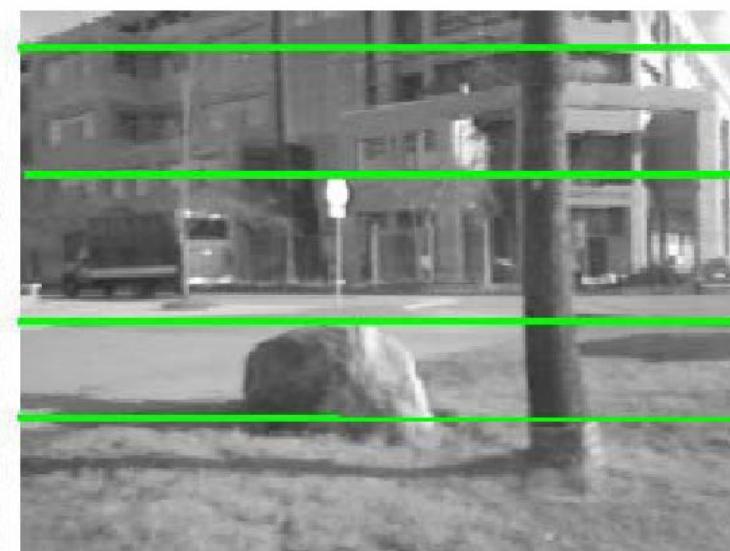

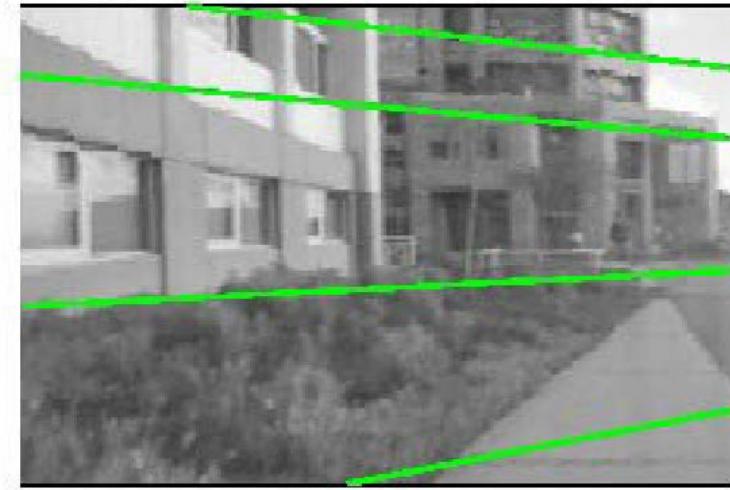

- Whenever two points  $x$  and  $x'$  lie on matching epipolar lines  $l$  and  $l'$ , the **visual rays** corresponding to them meet in space, i.e.,  $x$  and  $x'$  **could be** projections of the same 3D point  $X$

# Epipolar constraint

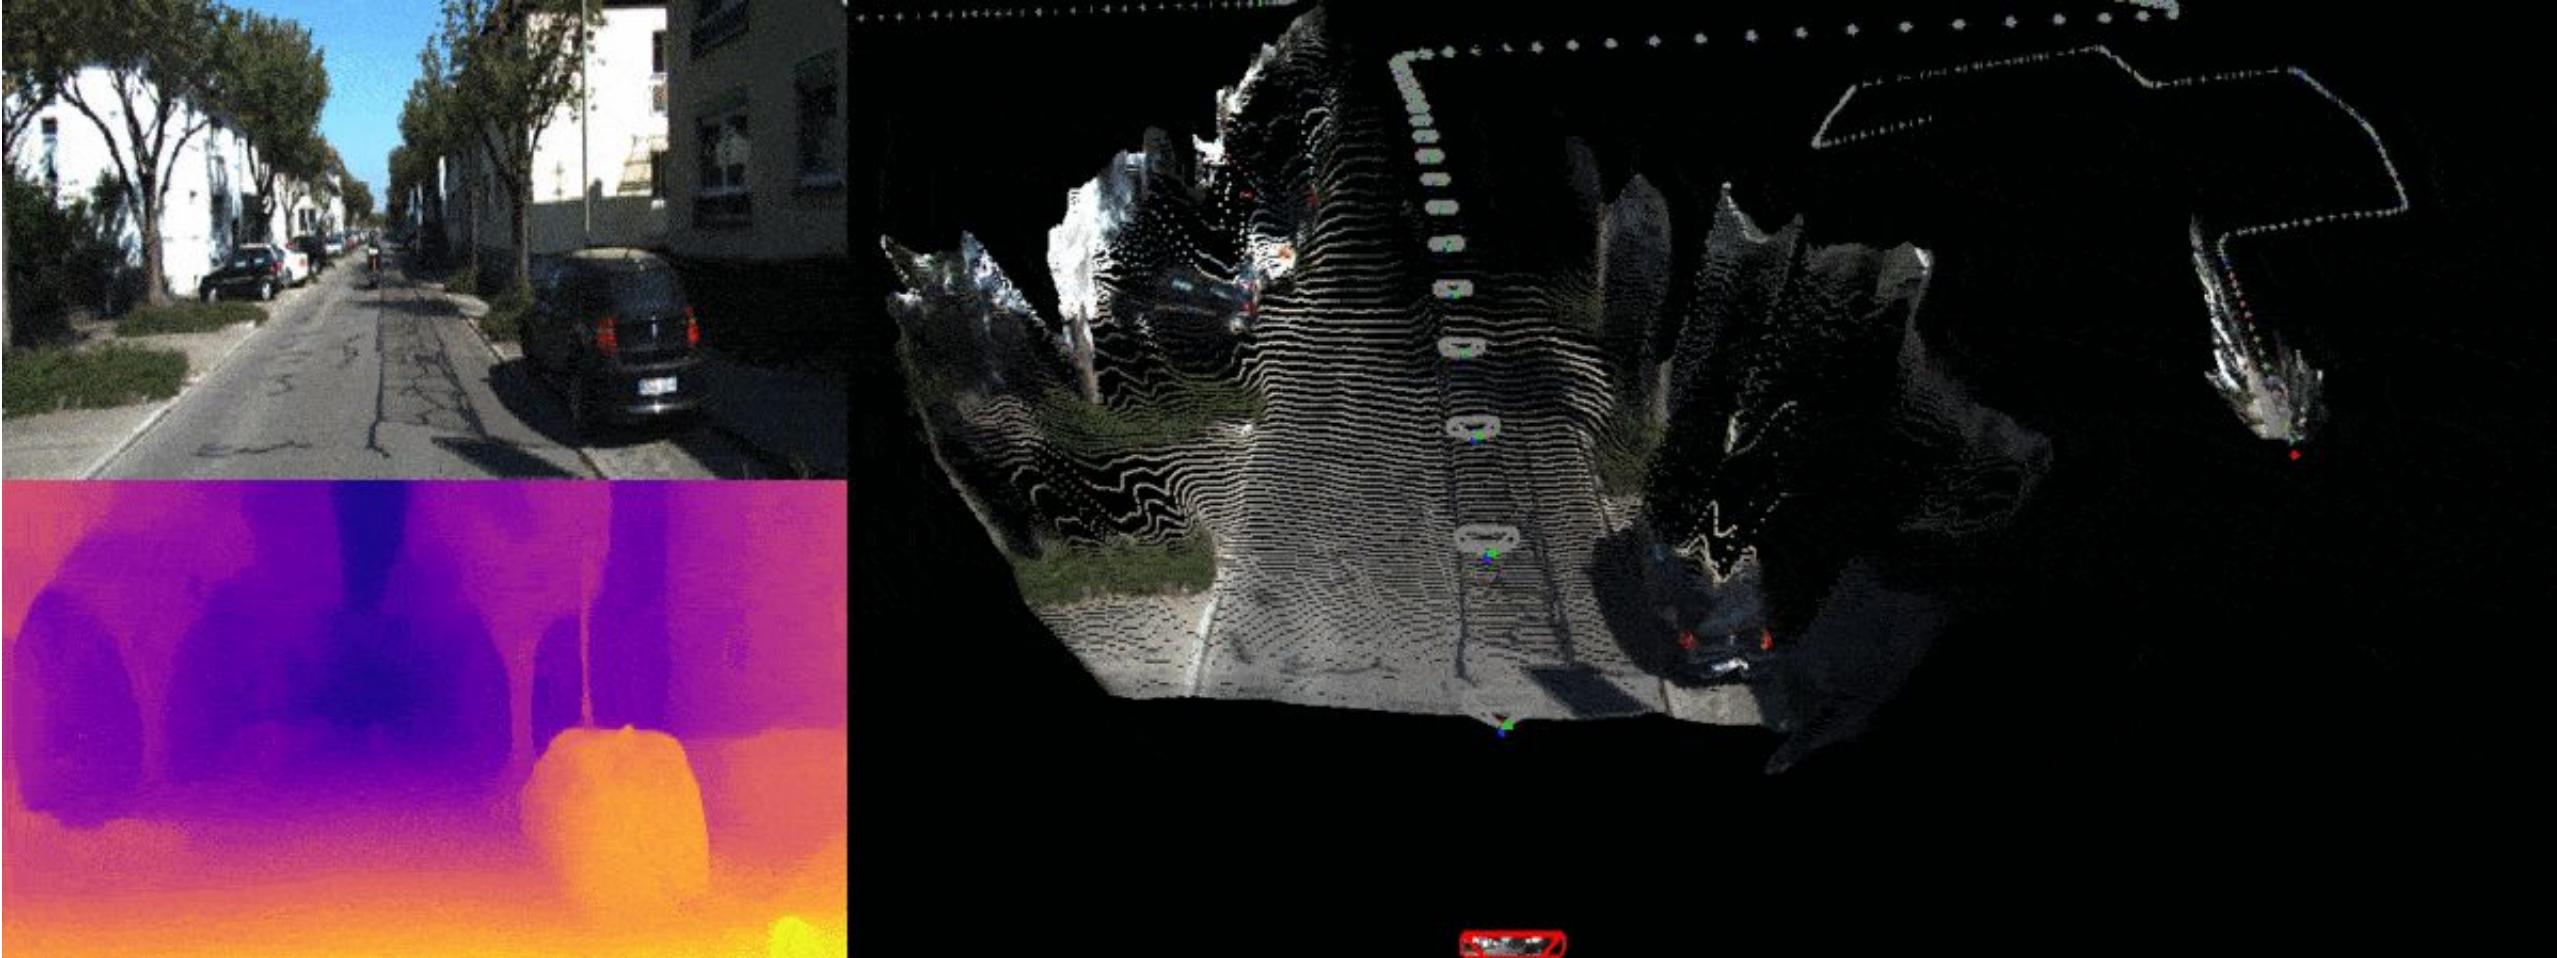

- Caveat: if  $\textcolor{violet}{x}$  and  $\textcolor{violet}{x}'$  satisfy the epipolar constraint, this doesn't mean they *have to be* projections of the same 3D point

# Epipolar constraint: Example

# The Epipolar Constraint as an Equation

$x'^T F x = 0$  where  $F = K'^{-T} E K^{-1}$  is called the **Fundamental Matrix** [1]

and  $E = [t]_x R$  is the **Essential Matrix** [2]

$$(x', y', 1) \begin{bmatrix} f_{11} & f_{12} & f_{13} \\ f_{21} & f_{22} & f_{23} \\ f_{31} & f_{32} & f_{33} \end{bmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix} = 0$$

(sketch of proof in appendix)

[1] Faugeras et al., (1992), Hartley (1992)

# Estimating the fundamental matrix - teaser

- Given correspondences  $\mathbf{x} = (x \ y \ 1)^T$  and  $\mathbf{x}' = (x' \ y' \ 1)^T$

# Estimating the fundamental matrix - teaser

- Given: 2D correspondences  $\mathbf{x} = (x, y, 1)^T$  and  $\mathbf{x}' = (x', y', 1)^T$
- Constraints:  $\mathbf{x}'^T \mathbf{F} \mathbf{x} = 0$  (1 per correspondence, how many needed?)
- Boils down to another homogeneous linear equation  $\mathbf{A}\mathbf{X} = \mathbf{0}$
- Recast once more into total least squares ([Sz.A.2.1](#)) due to noise
- SVD gives the solution as usual + enables enforcing rank 2 constraint by replacing smallest singular value with 0
- This “algebraic” algorithm is called “[normalized] 8-point algorithm” (R. Hartley. [In defense of the eight-point algorithm](#). TPAMI 1997)
- As in calibration and homography fitting: non-linear “geometric” optimization (of reprojected distances) is more precise
- Can be made robust to outliers via the RANSAC algorithm
- See appendix [H&Z ch. 9](#), [Szeliski 11.3](#), or take CS231A for more!

# From epipolar geometry to camera calibration

• Estimating the fundamental matrix is known as “weak calibration”

If we know the calibration matrices ( $K, K'$ ) of the two cameras,  
we can estimate the ***essential matrix***:  $E = K'^T F K$

The essential matrix gives us the relative rotation and translation  
between the cameras, or their ***extrinsic parameters*** ( $E = [t]_\times R$ )

Alternatively, if the calibration matrices are known (or in practice, if  
good initial guesses of the intrinsics are available), the five-point  
algorithm can be used to estimate relative camera pose

# What will we learn today?

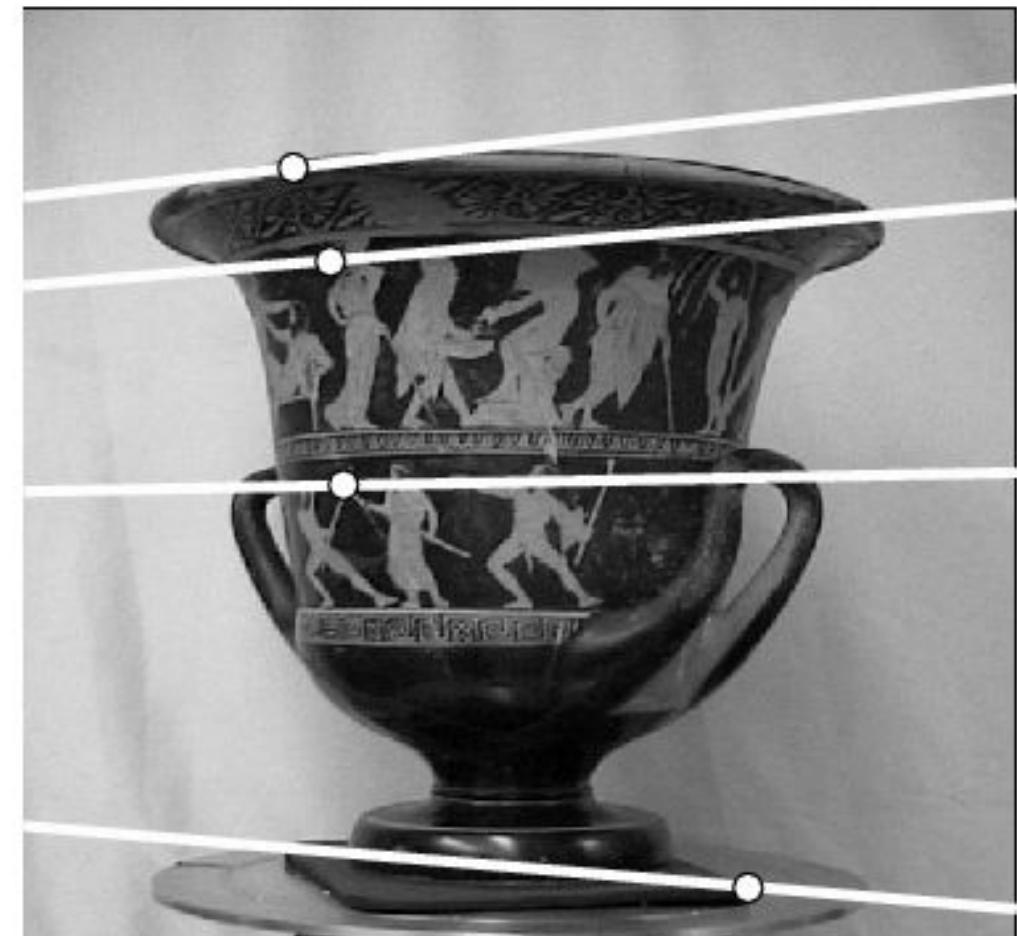

Triangulation

Epipolar geometry

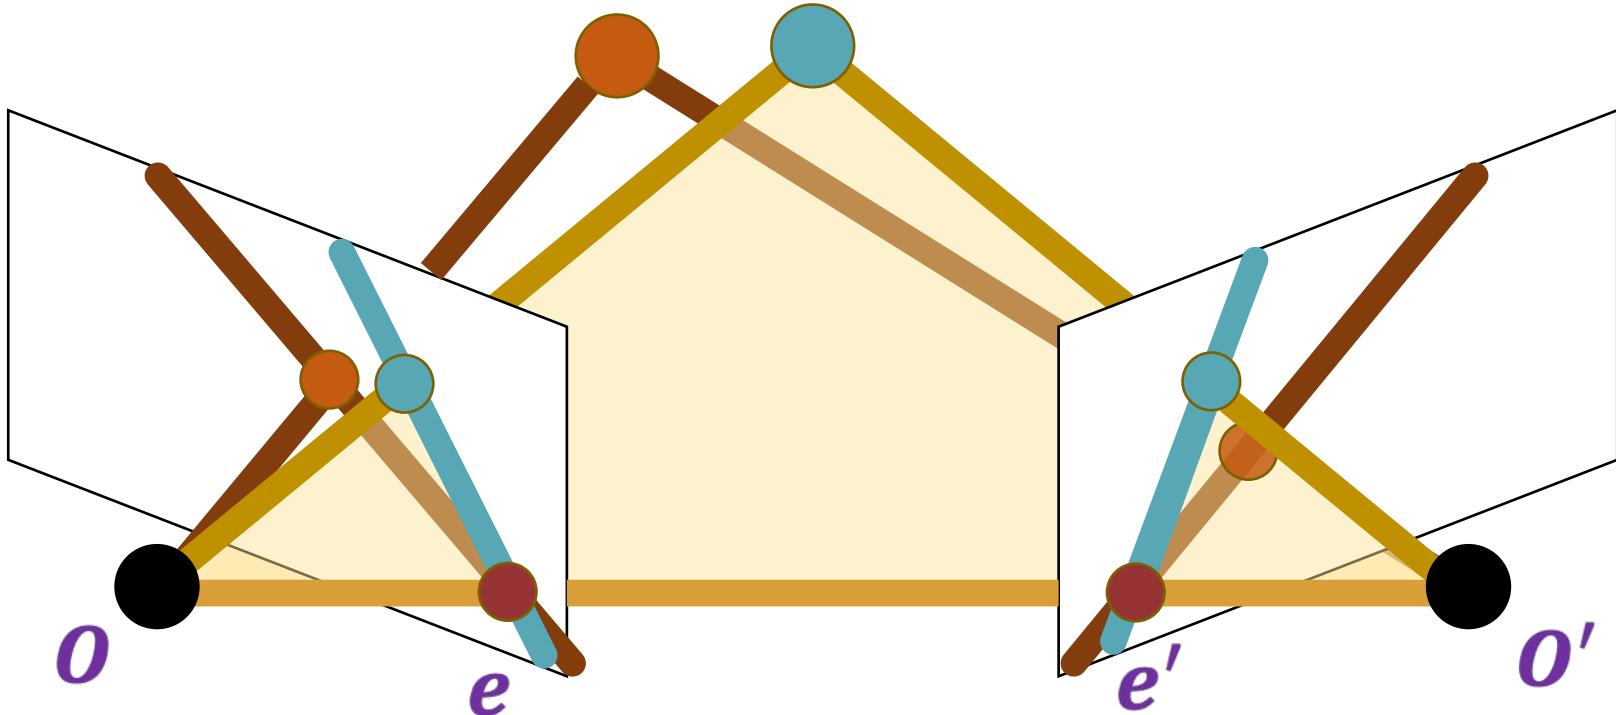

Stereo

Structure-from-Motion (SfM)

# Example configuration: Converging cameras

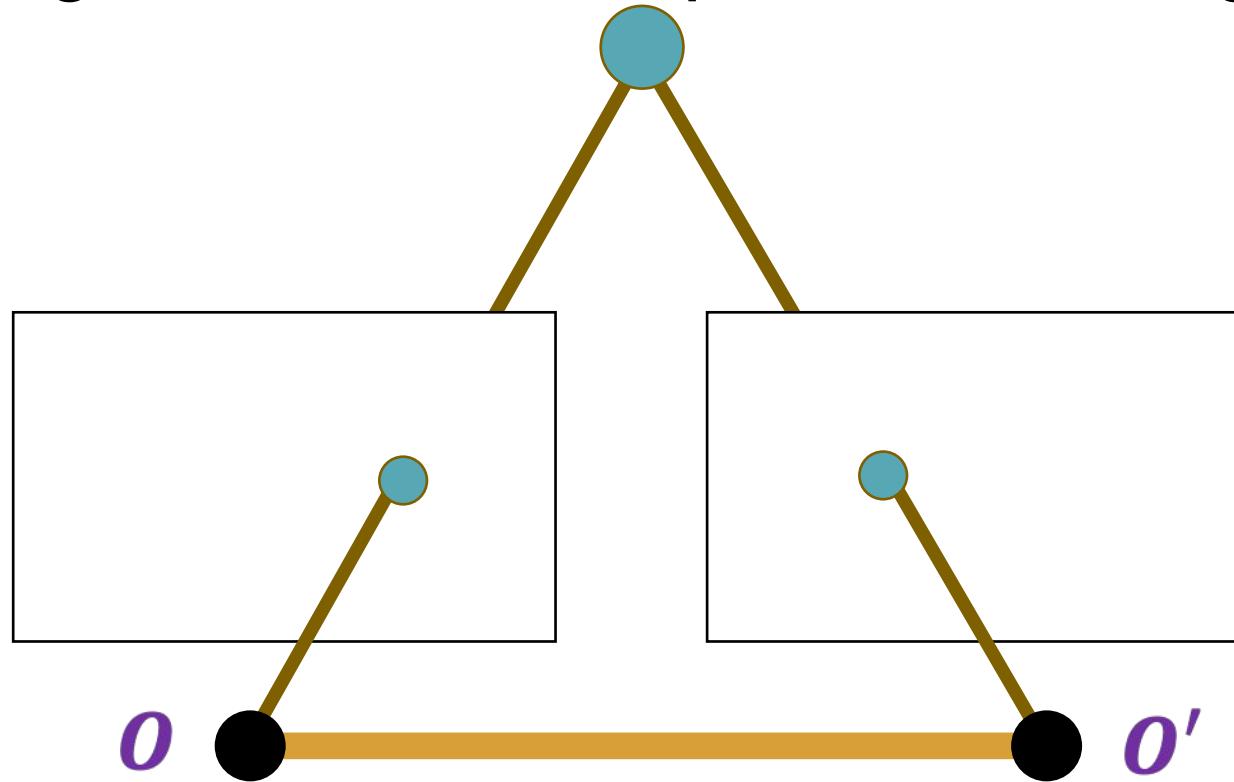

# Example configuration: Converging cameras

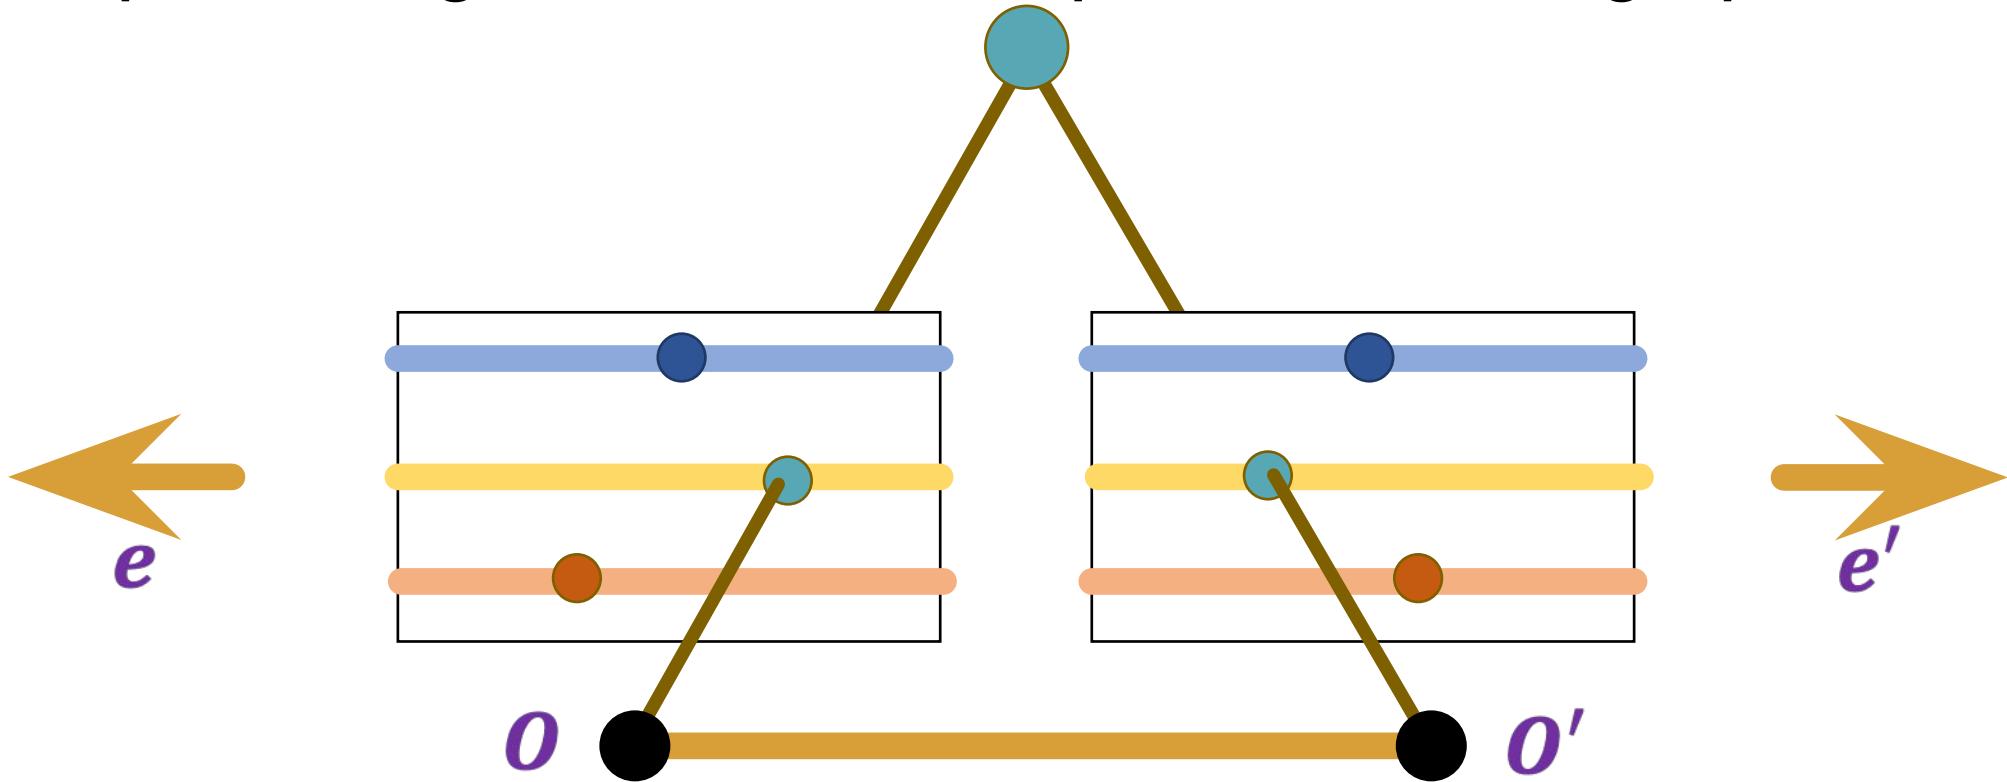

- Epipoles are finite, may be visible in the image

Example configuration: Motion parallel to image plane

Where are the epipoles?  
What do the epipolar lines look like?

# Example configuration: Motion parallel to image plane

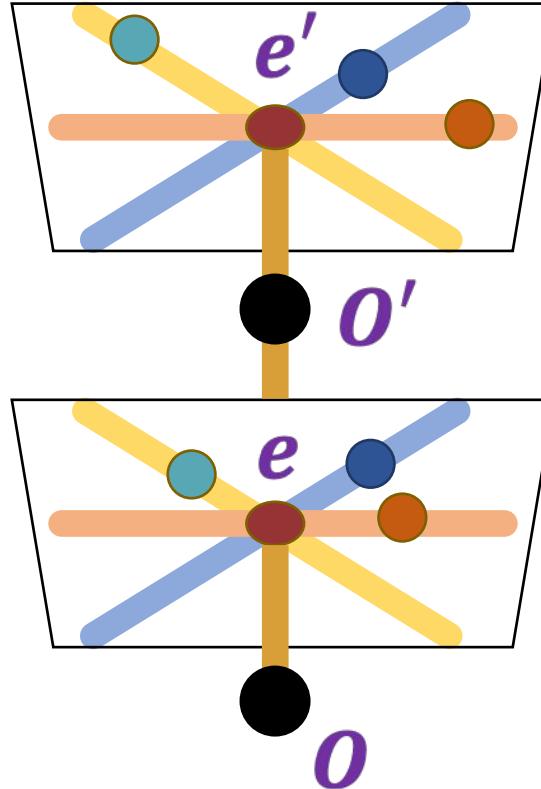

Epipoles *infinitely* far away!

Epipolar lines parallel: "scan lines"

Stereo = easier fronto-parallel special case!

# Example configuration: Motion perpendicular to image plane

- Epipole is the “focus of expansion” and coincides with the principal point of the camera
- Epipolar lines go out from principal point

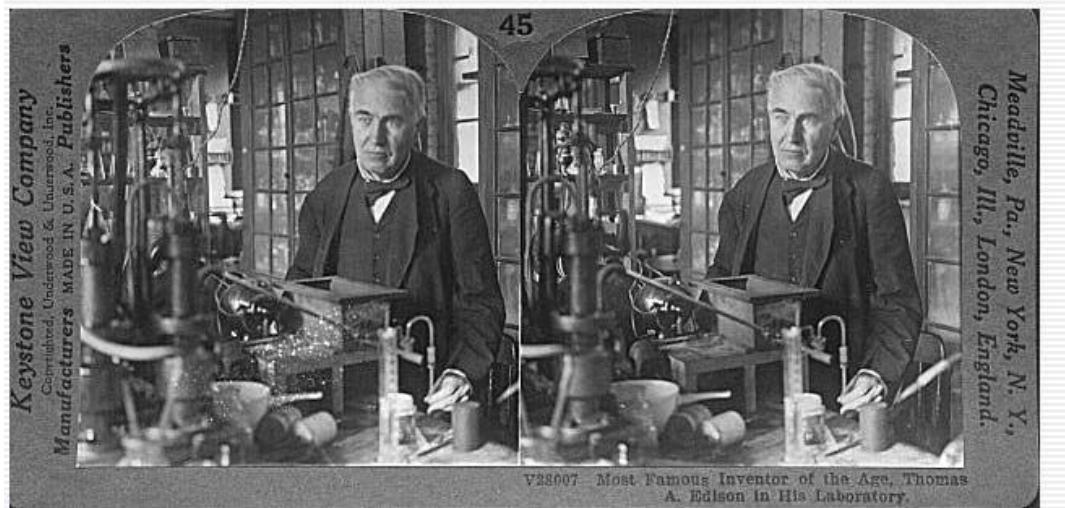

# History: Stereograms

History of stereograms

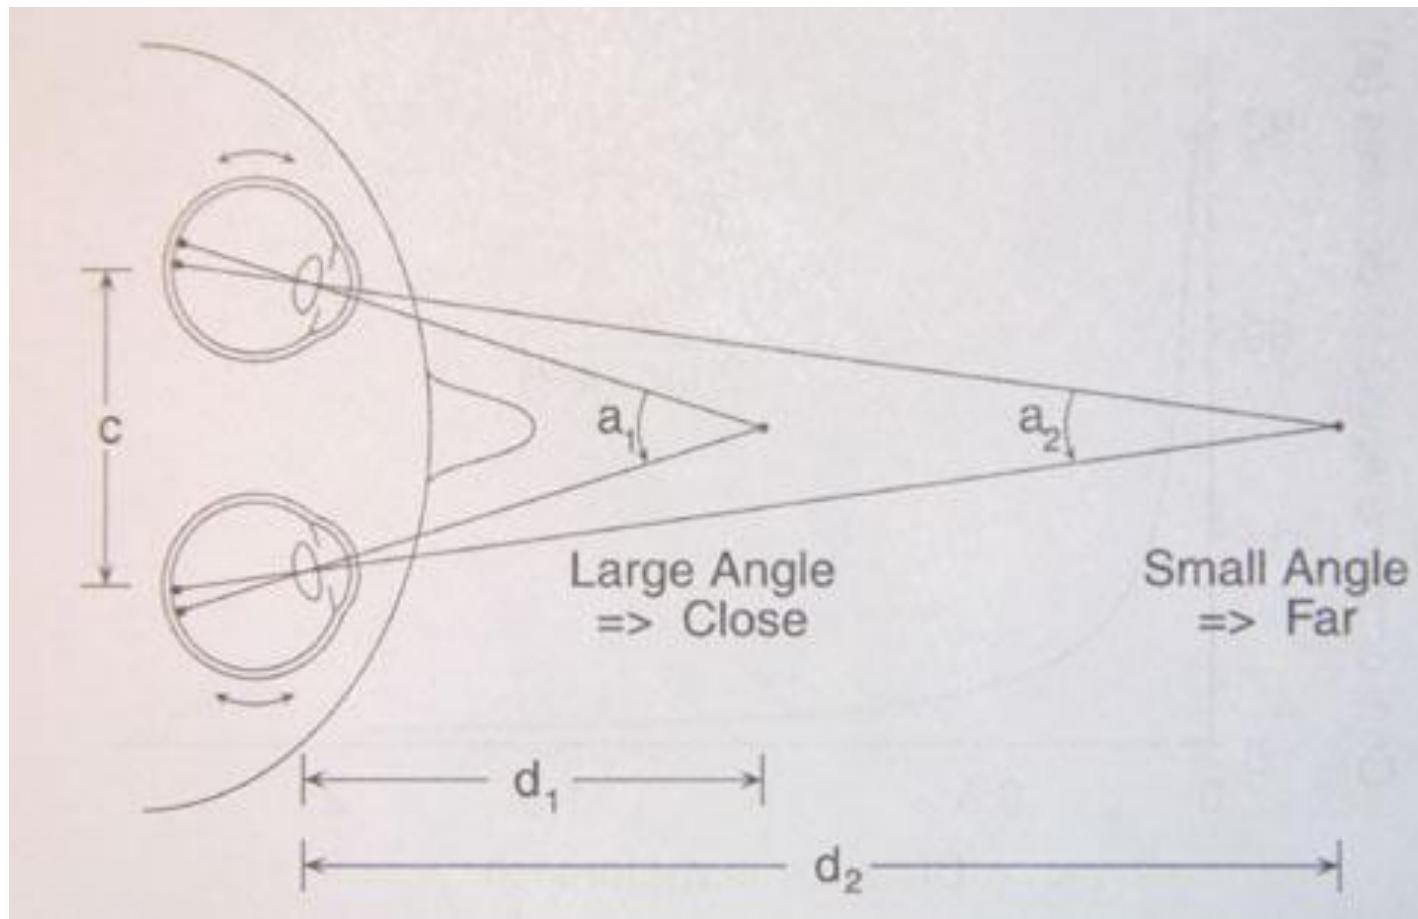

to get a set

Stereograms: Invented by Sir Charles Wheatstone, 1838

# Depth from convergence

$$d = \frac{c}{2\tan(a/2)}$$

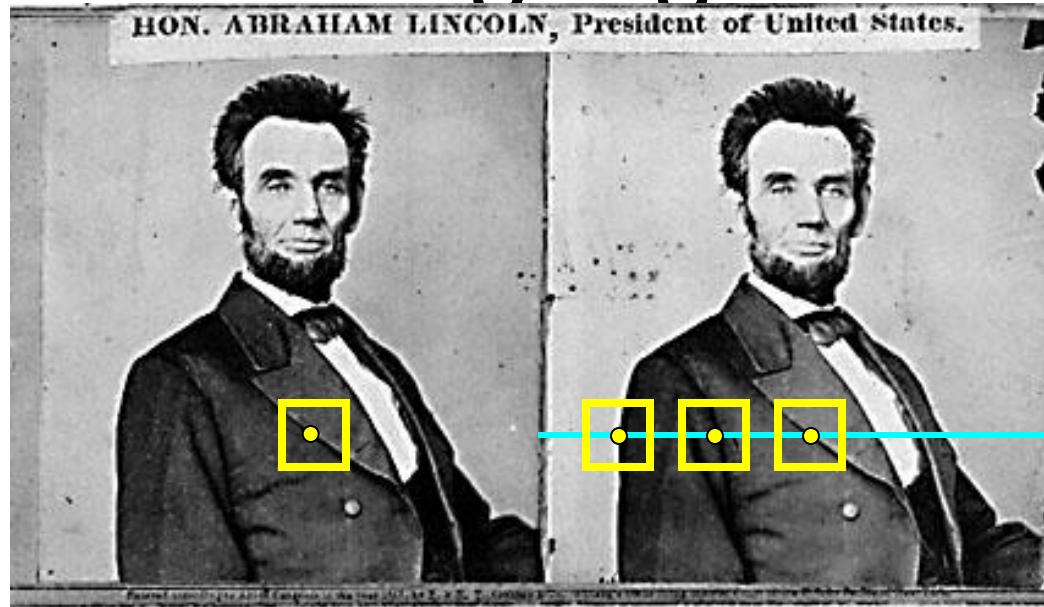

# Stereo Matching for Depth Estimation

**Given:** stereo pair (assumed calibrated)

**Wanted:** dense depth map

# Basic stereo matching algorithm

For each pixel in the first image

Find corresponding epipolar line in the right image: same row!

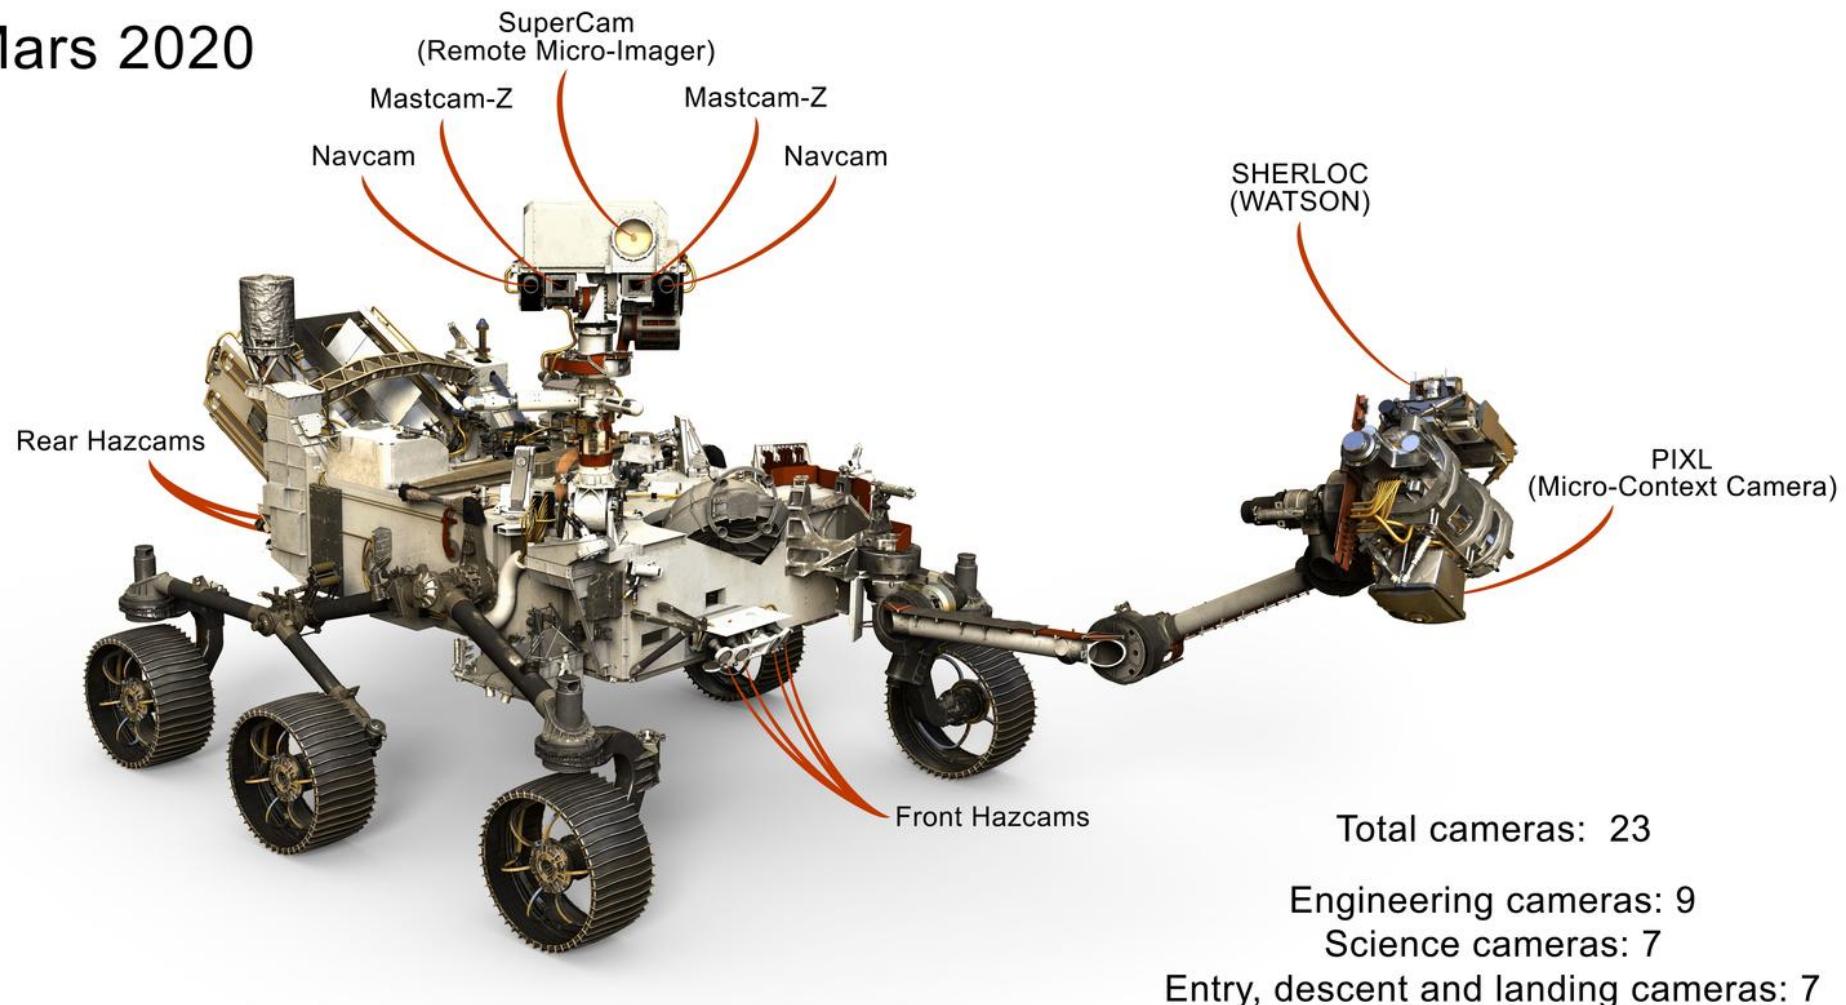

Examine all pixels on the epipolar line and pick the best match

Triangulate the matches to get depth information

More details in appendix: rectification, matching, depth from disparity, etc

# Structure-from-Motion

# Structure-from-Motion

Reconstruction  
(side)

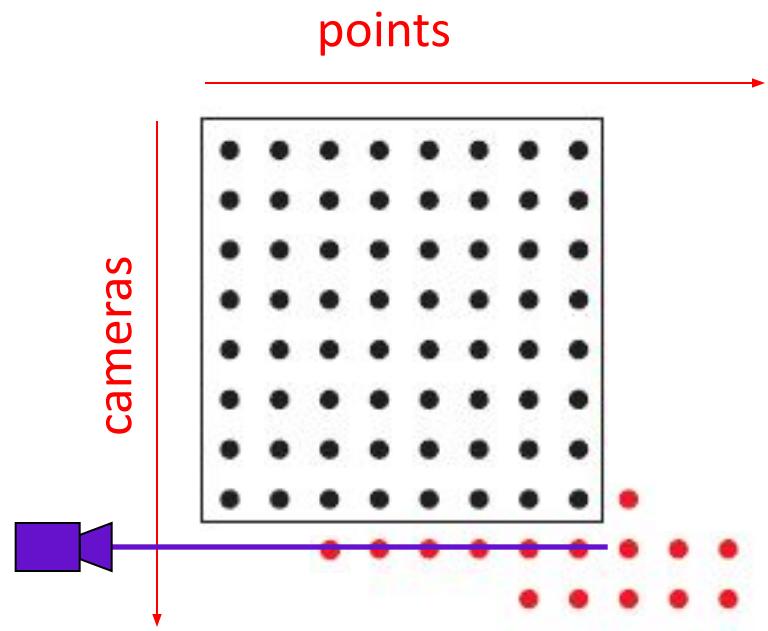

(top)

- Input: images with 2D points  $\mathbf{x}_{ij}$  in correspondence
- Output (solved simultaneously now!)
  - structure: 3D location  $\mathbf{X}_j$  for each point  $\mathbf{x}_{ij}$
  - motion: camera parameters  $\mathbf{R}_i$ ,  $\mathbf{t}_i$  & possibly  $\mathbf{K}_i$
- Objective function: minimize *reprojection error in 2D*

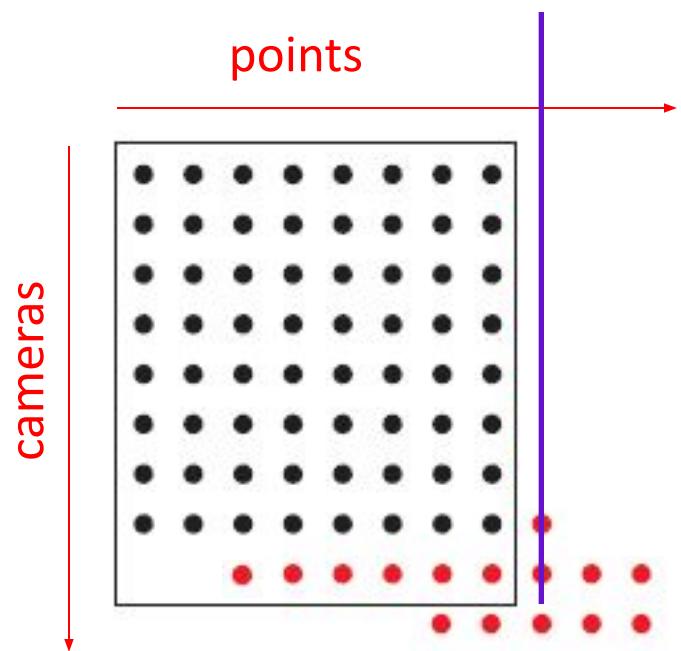

## Incremental Structure-from-Motion

- Initialize motion from two images using the fundamental matrix
- Initialize structure by triangulation
- For each additional view:
  - Determine projection matrix of new camera using all the known 3D points that are visible in its image – **calibration**

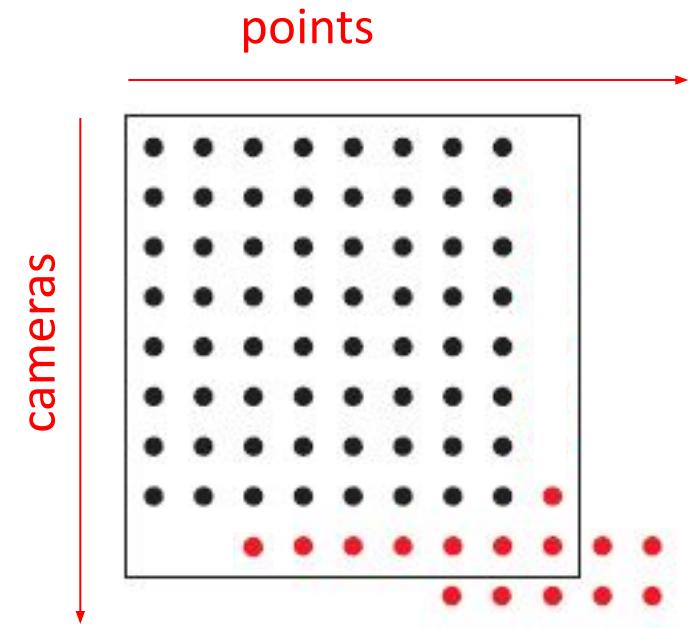

## Incremental Structure-from-Motion

- Initialize motion from two images using the fundamental matrix
- Initialize structure by triangulation
- For each additional view:
  - Determine projection matrix of new camera using all the known 3D points that are visible in its image – **calibration**
  - Refine and extend structure: compute newly visible 3D points, re-optimize existing points that are also seen by this camera – **triangulation**

## Incremental Structure-from-Motion

- Initialize motion from two images using the fundamental matrix
- Initialize structure by triangulation
- For each additional view:
  - Determine projection matrix of new camera using all the known 3D points that are visible in its image – **calibration**
  - Refine and extend structure: compute newly visible 3D points, re-optimize existing points that are also seen by this camera – **triangulation**

- Refine all cameras & points *jointly*: **bundle adjustment**

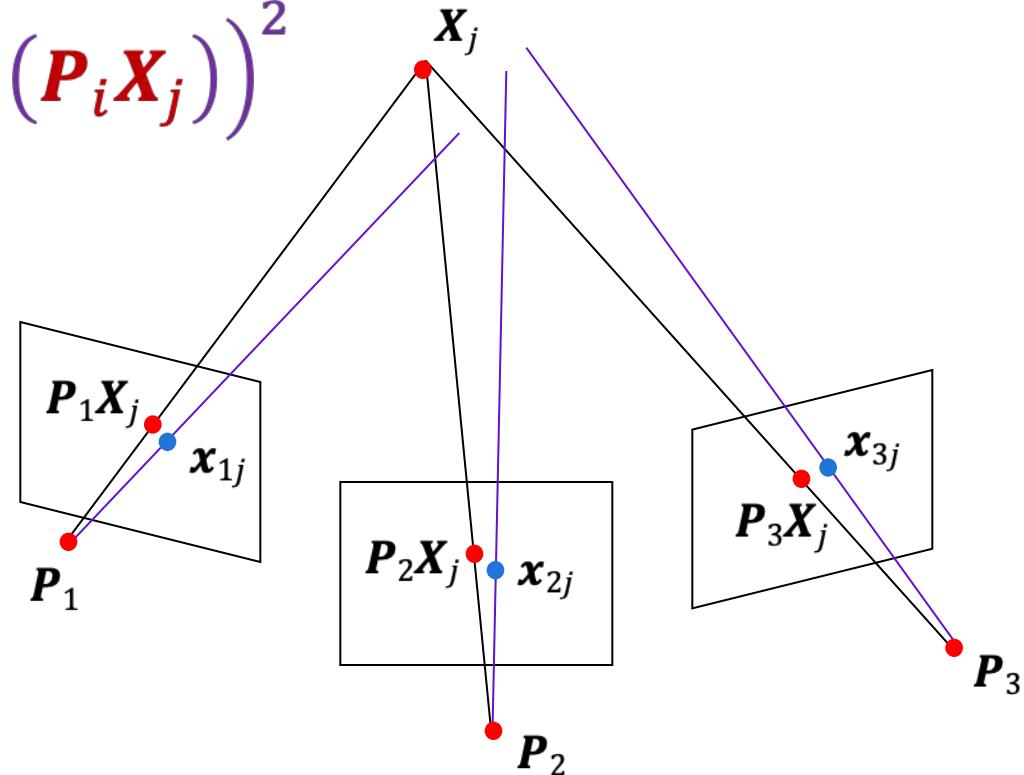

# Bundle Adjustment

Non-linear method for refining structure ( $\mathbf{X}_j$ ) and motion ( $\mathbf{P}_i$ )

Minimize reprojection error (with lots of bells and whistles):

$$\sum_{i=1}^m \sum_{j=1}^n w_{ij} d \left( \mathbf{x}_{ij} - \text{proj}(\mathbf{P}_i \mathbf{X}_j) \right)^2$$

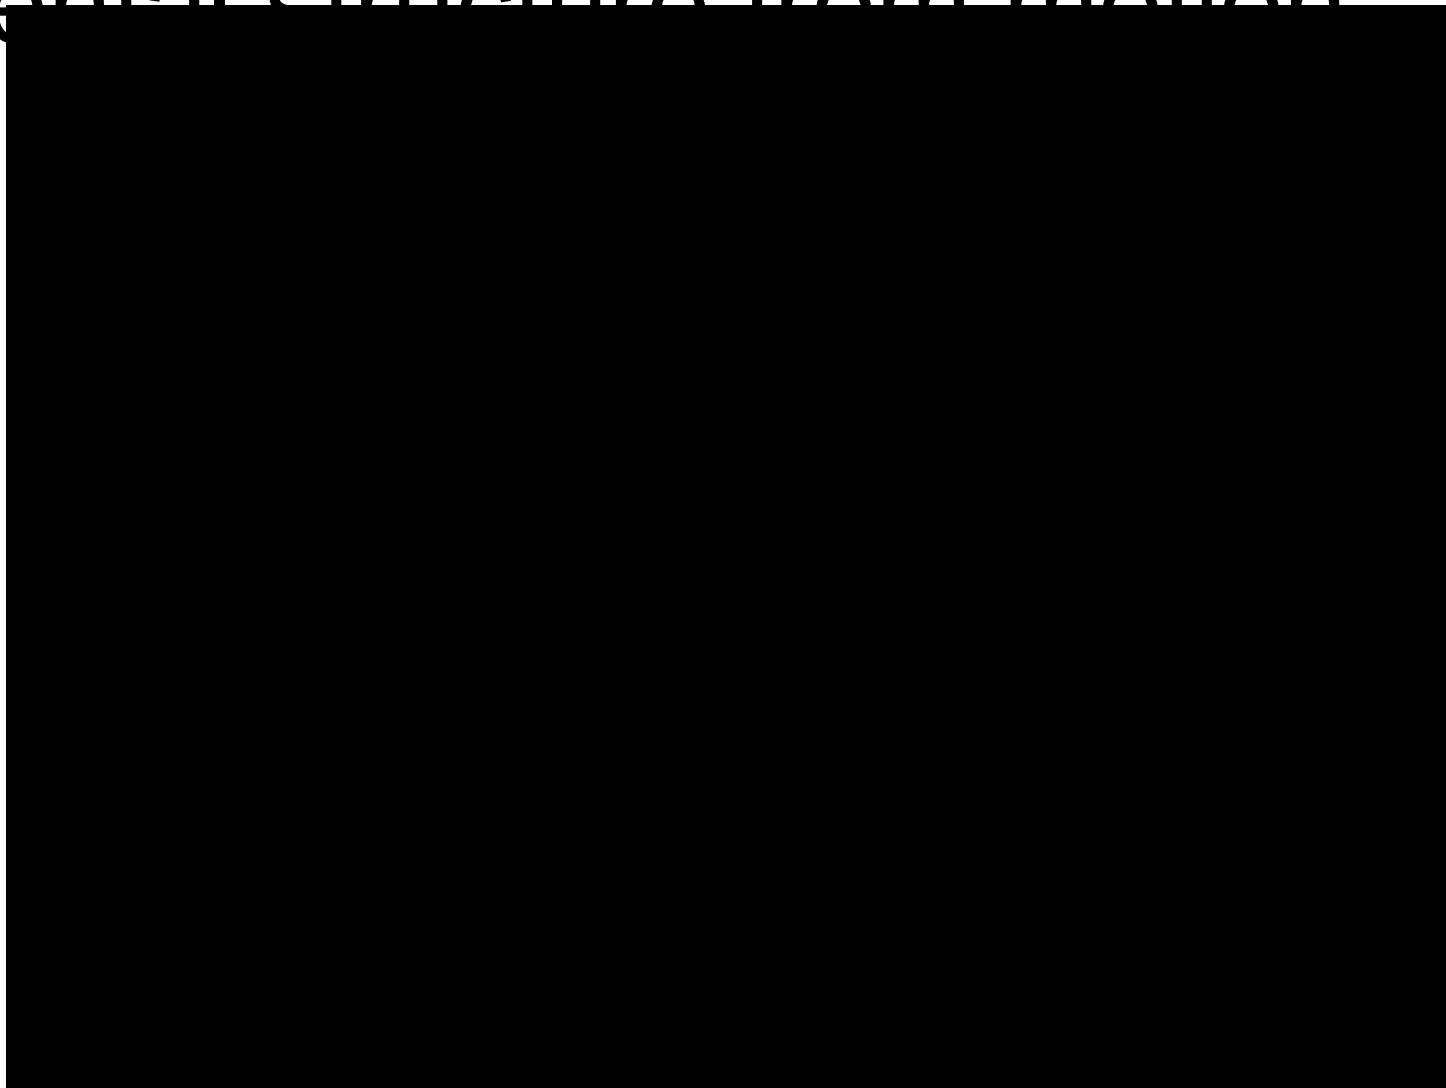

visibility flag: is  
point  $j$  visible in  
view  $i$ ?

# Incremental SfM in Practice

- Pick a pair of images with lots of inliers (and good EXIF data)
  - Initialize intrinsic parameters (focal length, principal point) from EXIF
  - Estimate extrinsic parameters ( $R$  and  $t$ ) using [five-point algorithm](#)
  - Use triangulation to initialize model points
- While remaining images exist
  - Find an image with many feature matches with images in the model
  - Run RANSAC on feature matches to register new image to model
  - Triangulate new points
  - Perform bundle adjustment to re-optimize everything
  - Optionally, align with GPS from EXIF data or ground control points

**Abstract.** Recent work has demonstrated that it is possible to learn deep neural networks for monocular depth and ego-motion estimation from unlabelled video sequences, an interesting theoretical development with numerous advantages in applications. In this paper, we propose a number of improvements to these approaches. First, since such self-supervised approaches are based on the brightness constancy assumption, which is valid only for a subset of pixels, we propose a probabilistic learning formulation where the network predicts distributions over variables rather than specific values. As these distributions are conditioned on the observed image, the network can learn which scene and object types are likely to violate the model assumptions, resulting in more robust learning. We also propose to build on dozens of years of experience in developing handcrafted structure-from-motion (SfM) algorithms. We do so by using an off-the-shelf SfM system to generate a supervisory signal for the deep neural network. While this signal is also noisy, we show that our probabilistic formulation can learn and account for the defects of SfM, helping to integrate different sources of information and boosting the overall performance of the network.

(b) proposed network architecture:  
the depth and pose-uncertainty networks  
are supervised by traditional SfM.
